**SHAMPOOS PROVIDING A SUPERIOR COMBINATION
OF ANTI-DANDRUFF EFFICACY AND CONDITIONING**

David Scott Dunlop

Roberta Atwood Boyd

Susan Marie Guskey

James Robert Schwartz

Anthony Raymond Marchetta

TECHNICAL FIELD OF THE INVENTION

The present invention relates to shampoo compositions which provide a superior combination of anti-dandruff efficacy and conditioning. These compositions contain anionic surfactants, conditioning agents, anti-dandruff agents, cationic polymers, and water. These anti-dandruff and conditioning shampoo compositions exhibit (a) at least a certain bioavailability/coverage index value, (b) less than or equal to a certain first conditioning index value, (c) at least a certain second conditioning index value, and (d) at least a certain minimal inhibitory concentration index value, as defined herein.

BACKGROUND OF THE INVENTION

Shampoo compositions comprising various combinations of deterative surfactants and conditioning agents, especially silicone conditioning agents, are known in the art and are commercially available. Many of these compositions have been found to provide excellent hair cleansing and conditioning performance. For example, Pantene® Shampoo Plus Pro-Vitamin Conditioner-in-One formulas which contain anionic surfactants, a cationic polymer and silicone conditioning agents provide excellent cleaning, conditioning and hair feel benefits upon application to hair.

Anti-dandruff shampoos are also well known in the art and are also commercially available. Anti-dandruff shampoos typically incorporate an anti-dandruff active and deterative surfactants. Among the preferred type of anti-dandruff agents are particulate, crystalline anti-dandruff agents, such as

sulfur, selenium disulfide and heavy metal salts of pyridinethione. Soluble anti-dandruff agents, such as ketoconazole, are also known in the art.

Anti-dandruff shampoos which also provide conditioning benefits are likewise known in the art. For example, U.S. Pat. No. 5,624,666 exemplifies and claims shampoo compositions, which contain anionic surfactants, cationic polymers and zinc pyridinethione, as an anti-dandruff agent. U.S. Pat. No. 5,624,666 teaches that conditioning agents such as silicone fluids can optionally be incorporated into the compositions therein. Head & Shoulders® Dandruff Shampoo Plus Conditioner is an example of a marketed product which provides both anti-dandruff and conditioning benefits upon application of the shampoo to hair.

Nevertheless, some consumers desire a shampoo which provides a superior combination of anti-dandruff efficacy and conditioning performance versus currently marketed products. Such a superior combination of efficacy and conditioning can be difficult to achieve.

For example, one way to achieve excellent conditioning benefits is to employ a fairly high level of cationic polymer in the shampoo composition. However, the use of high levels of cationic polymer can affect the characteristics of the coacervate formed between the cationic polymer and the anionic surfactant in a manner which negatively impacts the deposition of the anti-dandruff active on the hair and scalp. Thus, it has heretofore been believed that the level of cationic polymer had to be balanced to provide the best balance of conditioning and anti-dandruff efficacy.

Also by way of example, it was previously believed that excellent anti-dandruff efficacy could be achieved by utilizing a coacervate to deposit anti-dandruff actives on the hair and scalp. Unfortunately, the use of coacervates to deposit anti-dandruff actives on the hair or scalp can negatively affect conditioning, specifically clean hair feel. In order to achieve good conditioning, the level of anti-dandruff agent could be reduced, resulting in good conditioning, but less than optimal anti-dandruff efficacy.

Applicants have now discovered, however, that, surprisingly, bioavailability and coverage of the anti-dandruff active are much more predictive of efficacy than deposition of the active on the hair or scalp. In fact, Applicants have found that, in some cases, even when an anti-dandruff active deposited very well on the hair and scalp, acceptable anti-dandruff efficacy was not achieved. Conversely, good anti-dandruff efficacy could be achieved in situations where the anti-dandruff active had good coverage and was highly bioavailable, but did not deposit superiorly to the hair or scalp. Thus, in order for a shampoo composition to provide a superior combination of anti-dandruff efficacy and conditioning compared to known shampoo compositions, it must meet certain criteria with respect to bioavailability and coverage, but it does not necessarily have to have the ability to deposit the anti-dandruff active superiorly on the hair or scalp.

Applicants have found that four requirements must be satisfied in order to provide shampoo compositions which provide a superior combination of efficacy and conditioning. Particularly, (1) bioavailability and coverage of the anti-dandruff active are important to anti-dandruff efficacy; (2) comb-ability of wet hair and (3) clean hair feel are important to the consumer perception of well-conditioned hair; and (4) the inherent ability of the anti-dandruff active to inhibit the growth of microorganisms has an impact on the anti-dandruff efficacy as well as overall consumer acceptance of the shampoo product.

Whether or not the requisite criteria are met for a given shampoo composition depends on a number of aspects of the shampoo formulation including, for example, the level and type of cationic polymer employed in the composition, the type of anti-dandruff agent employed, the amount of anionic surfactant employed, the level and type of polyalkylene glycol employed, if any, and the rheological characteristics of the coacervate.

It is an object of the present invention to provide shampoo compositions, which provide a superior combination of anti-dandruff efficacy and conditioning. It is also an object of the present invention to provide a method for cleansing and conditioning the hair. These, and other objects, will become readily apparent from the detailed description below.

SUMMARY OF THE INVENTION

The present invention relates to a shampoo composition comprising: (A) from about 5% to about 50%, by weight, of an anionic surfactant; (B) from about 0.01% to about 10%, by weight, of a non-volatile conditioning agent; (C) from about 0.1% to about 4%, by weight, of an anti-dandruff agent; (D) from about 0.02% to about 5%, by weight, of at least one cationic polymer; and (E) water. The composition (A) has a bioavailability/coverage index value, as defined herein, of at least about 1.25; (B) has a first conditioning index value, as defined herein, of less than or equal to about 1.0; (C) has a second conditioning index value, as defined herein, of at least about 1.5; and (D) has a minimal inhibitory concentration index value, as defined herein, of at least about 0.125.

The present invention further relates to a method for providing anti-dandruff efficacy and conditioning hair comprising applying to the hair and scalp an amount of the above-described composition which is effective to provide such benefits.

DETAILED DESCRIPTION OF THE INVENTION

The shampoo compositions of the present invention provide a superior combination of anti-dandruff efficacy and conditioning. Such anti-dandruff and conditioning shampoo compositions can comprise, consist of, or consist essentially of the essential elements and limitations of the invention

described herein, as well as any of the additional or optional ingredients, components or limitations described herein.

Particularly, these compositions comprise anionic surfactants, conditioning agents, anti-dandruff agents, cationic polymers, and water. More particularly, these compositions exhibit certain characteristics which are measured by four indices, defined herein.

The shampoo compositions of the present invention have a bioavailability/coverage index value of at least about 1.25, preferably at least about 1.5, more preferably at least about 2.0. This index is indicative of anti-dandruff efficacy. Generally, the higher the index value of the composition, the better its anti-dandruff efficacy, due to more bioavailable anti-dandruff agent, increased coverage of anti-dandruff agent, or both. Applicants have discovered that, surprisingly, bioavailability and coverage of the anti-dandruff active are much more predictive of efficacy than deposition of the active on the hair or scalp. In fact, Applicants have found that, in some cases, even when an antidandruff active deposited very well on the hair and scalp, acceptable anti-dandruff efficacy was not achieved. Conversely, good anti-dandruff efficacy could be achieved in situations where the anti-dandruff active had good coverage and was highly bioavailable, but did not deposit superiorly to the hair or scalp.

Applicants believe that there are a number of ways to increase the bioavailability of the anti-dandruff active. For example, the composition can be formulated (as hereinafter described) such that the anti-dandruff active is present on the surface of the coacervate (i.e., loosely associated with the coacervate) rather than integrated into or encapsulated by the coacervate. Another way to increase bioavailability of the anti-dandruff active is to formulate the composition (as hereinafter described) such that the coacervate is spreadable or flowable (rather than elastic) to increase the bioavailability of any anti-dandruff active that is integrated into or encapsulated by the coacervate.

The shampoo compositions of the present invention have a first conditioning index value of less than or equal to about 1.0, preferably less than or equal to about 0.96, more preferably less than or equal to about 0.94, most preferably less than or equal to about 0.91. This index is indicative of conditioning, as realized by consumers of the shampoo composition. Generally, the lower the index value of the composition, the better its conditioning, due to easier to comb and less tangled wet hair.

The shampoo compositions of the present invention have a second conditioning index value of at least about 1.5, preferably at least about 1.75, more preferably at least about 2.0, still more preferably at least about 2.25, most preferably at least about 2.5. This index is indicative of conditioning, as realized by consumers of the shampoo composition. Generally, the higher the index value of the composition, the better its conditioning, due to increased clean hair feel.

The shampoo compositions of the present invention have a minimal inhibitory concentration index value of at least about 0.125, preferably at least about 0.25, more preferably at least about 0.5. This index is indicative of anti-dandruff efficacy. Generally, the higher the index value of the

composition, the better its anti-dandruff efficacy, due to increased inherent ability of the anti-dandruff agent to inhibit the growth of microorganisms.

The components, including those which may optionally be added, of the shampoo compositions of the present invention, as well as methods for preparation, methods for use are described in detail below. Also, methods for assessing the four indices are described in detail.

I. Components

The anti-dandruff and conditioning shampoo compositions of the present invention comprise an anionic surfactant, a conditioning agent, an anti-dandruff agent, a cationic polymer, and water. Each of these ingredients is described in detail below.

A. Anionic surfactant

The anti-dandruff and conditioning shampoo compositions of the present invention comprise from about 5% to about 50%, by weight of the composition, preferably from about 8% to about 30%, more preferably from about 10% to about 25%, most preferably from about 12% to about 18%, of an anionic deterative surfactant component suitable for application to the hair or skin. The anionic deterative surfactant is believed to provide cleaning and lather performance to the composition. Additionally, the anionic deterative surfactant forms a coacervate, upon aqueous dilution, with the cationic polymer component (described below) of the present invention. This coacervate is believed to be important in providing the efficacy and conditioning benefits described herein.

The anionic deterative surfactant component can comprise an anionic deterative surfactant, a zwitterionic or an amphoteric deterative surfactant having an attached moiety that is anionic at the pH of the composition, or a combination thereof; preferably an anionic deterative surfactant. Such surfactants should be physically and chemically compatible with the essential components described herein, and should not otherwise unduly impair product stability, aesthetics or performance. Examples of anionic deterative surfactants which may be suitably employed in the shampoo compositions herein include, but are not limited to: sulfates, sulfonates, sarcosinates and sarcosine derivatives.

1. Sulfates

Preferred anionic deterative surfactants for use in the anti-dandruff and conditioning shampoo compositions of the present invention are the alkyl and alkyl ether sulfates. These surfactants have the respective formulae ROSO_3M and $\text{R}(\text{C}_2\text{H}_4\text{O})_x\text{OSO}_3\text{M}$, wherein R is alkyl or alkenyl from about C_8 to about C_{18} , x is an integer having a value from 1 to 10, and M is a cation selected from the group consisting of electropositive covalently bonded moieties (e.g. ammonium), alkanolamines (e.g. triethanolamine), monovalent metals (e.g. sodium or potassium), polyvalent metal cations (e.g. magnesium and calcium) and mixtures thereof. The cation M should be selected such that the anionic

deterative surfactant component is water soluble. Solubility of the surfactant will depend upon the particular anionic deterative surfactants and cations chosen.

Preferably, **R** is from about C_8 to about C_{18} , more preferably from about C_{10} to about C_{16} , most preferably from about C_{12} to about C_{14} , in both the alkyl and alkyl ether sulfates. The alkyl ether sulfates are typically made as condensation products of ethylene oxide and monohydric alcohols from about C_8 to about C_{24} . The alcohols can be synthetic or they can be derived from fats, e.g., coconut oil, palm kernel oil, and tallow. Lauryl alcohol and straight chain alcohols derived from coconut oil or palm kernel oil are preferred. Such alcohols are reacted with from 0 to about 10, preferably from about 2 to about 5, most preferably about 3, moles of ethylene oxide. The resulting mixture of molecular species will have, for example, an average of 3 moles of ethylene oxide per mole of alcohol, and is sulfated and neutralized.

Non-limiting examples of alkyl ether sulfates which may be used in the shampoo compositions of the present invention include sodium and ammonium salts of coconut alkyl triethylene glycol ether sulfate, tallow alkyl triethylene glycol ether sulfate, and tallow alkyl hexaoxyethylene sulfate. Preferred alkyl ether sulfates are those comprising a mixture of individual compounds, wherein the compounds in the mixture have an average alkyl chain length from about C_{10} to about C_{16} and an average degree of ethoxylation of from about 1 to about 4 moles of ethylene oxide.

Specific examples of preferred alkyl sulfates include, but are not limited to, ammonium lauryl sulfate, ammonium cocoyl sulfate, potassium lauryl sulfate, potassium cocoyl sulfate, sodium lauryl sulfate, sodium cocoyl sulfate, monoethanolamine lauryl sulfate, monoethanolamine cocoyl sulfate, diethanolamine lauryl sulfate, triethanolamine lauryl sulfate, triethylamine lauryl sulfate, and mixtures thereof. Especially preferred is ammonium lauryl sulfate.

Specific examples of preferred alkyl ether sulfates include, but are not limited to, ammonium laureth sulfate, potassium laureth sulfate, sodium laureth sulfate, monoethanolamine laureth sulfate, diethanolamine laureth sulfate, triethanolamine laureth sulfate, triethylamine laureth sulfate, and mixtures thereof. Especially preferred is ammonium laureth sulfate.

Still another class of sulfate surfactants suitable for use in the for use in the anti-dandruff and conditioning shampoos of the present invention are the sulfated glycerides, an example of which includes, but is not limited to, lauric monoglyceride sodium sulfate.

2. Sulfonates

Also suitable for use in the anti-dandruff and conditioning shampoos of the present invention are those anionic deterative surfactants known as olefin sulfonates. As used herein, the term "olefin sulfonates" refers to compounds which can be produced by the sulfonation of α -olefins by means of uncomplexed sulfur trioxide, followed by neutralization of the acid reaction mixture in conditions such that any sulfones which have been formed in the reaction are hydrolyzed to give the corresponding

hydroxy-alkanesulfonates. The sulfur trioxide can be liquid or gaseous, and is usually, but not necessarily, diluted by inert diluents, for example by liquid SO_2 , chlorinated hydrocarbons, and the like, when used in the liquid form, or by air, nitrogen, gaseous SO_2 , and the like, when used in the gaseous form. The α -olefins from which the olefin sulfonates are derived are mono-olefins which are from about C_{10} to about C_{24} , preferably from about C_{12} to about C_{16} . Preferably, they are straight chain olefins. In addition to the true alkene sulfonates and a proportion of hydroxy-alkanesulfonates, the olefin sulfonates can contain minor amounts of other materials, such as alkene disulfonates depending upon the reaction conditions, proportion of reactants, the nature of the starting olefins and impurities in the olefin stock and side reactions during the sulfonation process. A non-limiting example of such an α -olefin sulfonate mixture is described in U.S. Pat. No. 3,332,880, which description is incorporated herein by reference.

Another class of sulfonates suitable for use in the anti-dandruff and conditioning shampoo compositions of the present invention are those anionic deterative surfactants known as β -alkyloxy alkane sulfonates. These surfactants conform to the general Formula (I):

where R^1 is a straight chain alkyl group from about C_6 to about C_{20} , R^2 is a lower alkyl group from about C_1 to about C_3 , preferably C_1 , and M is a water-soluble cation, as described above.

Still other sulfonates suitable for use in the anti-dandruff and conditioning shampoo compositions of the present invention are those anionic deterative surfactants known as alkyl aryl sulfonates. Non-limiting examples of alkyl aryl sulfonates include sodium tridecyl benzene sulfonate, sodium dodecyl benzene sulfonate, and mixtures thereof.

Other suitable sulfonates for use in the anti-dandruff and conditioning shampoos of the present invention are the water-soluble salts of organic, sulfuric acid reaction products conforming to the formula $[\text{R}^1\text{-SO}_3\text{-M}]$ where R^1 is a straight or branched chain, saturated, aliphatic hydrocarbon radical from about C_8 to about C_{24} , preferably about C_{10} to about C_{18} ; and M is a cation described above. Non-limiting examples of such anionic deterative surfactants are the salts of an organic sulfuric acid reaction product of a hydrocarbon of the methane series, including *iso*-, *neo*-, and *n*-paraffins, and a sulfonating agent, e.g., SO_3 , H_2SO_4 , obtained according to known sulfonation methods. The sulfonation methods may include bleaching and hydrolysis. The salts are preferably from about C_8 to about C_{24} ; more

preferably from about C₁₂ to about C₁₈. Preferred are alkali metal and ammonium sulfonated C₁₀ to C₁₈ *n*-paraffins.

Still other suitable sulfonates for use in the anti-dandruff and conditioning shampoo compositions of the present invention are the reaction products of fatty acids, which are esterified with isethionic acid, and then neutralized with sodium hydroxide. Preferred fatty acids are those derived from coconut oil or palm kernel oil. Also suitable are the sodium or potassium salts of fatty acid amides of methyl tauride in which the fatty acids are derived from coconut oil or palm kernel oil. Other similar anionic surfactants are described in U.S. Pat. No. 2,486,921; U.S. Pat. No. 2,486,922; and U.S. Pat. No. 2,396,278, which descriptions are incorporated herein by reference.

Other sulfonates suitable for use in the anti-dandruff and conditioning shampoo compositions of the present invention are the succinates, examples of which include, but are not limited to, disodium N-octadecylsulfosuccinate, disodium lauryl sulfosuccinate, diammonium lauryl sulfosuccinate, tetrasodium N-(1,2-dicarboxyethyl)-N-octadecylsulfosuccinate, diamyl ester of sodium sulfosuccinic acid, dihexyl ester of sodium sulfosuccinic acid, dioctyl esters of sodium sulfosuccinic acid, and mixtures thereof.

3. Sarcosinates and sarcosine derivatives

Also suitable for use in the anti-dandruff and conditioning shampoos of the present invention are those anionic detergent surfactants known as sarcosinates and sarcosine derivatives. Sarcosinates are the derivatives of sarcosine and N-methyl glycine, acylated with a fatty acid chloride. They conform to the general Formula (II):

wherein RCO- is a fatty acid radical and wherein X is either hydrogen (acid form) or a cationic species, such as Na⁺ or TEA⁺ (salt form). Non-limiting examples of sarcosinates and sarcosine derivatives include: sodium lauryl sarcosinate, lauryl sarcosine, cocoyl sarcosine, and mixtures thereof. A preferred sarcosinate is sodium lauryl sarcosinate.

B. Conditioning agent

The anti-dandruff and conditioning shampoo compositions of the present invention comprise from about 0.01% to about 10%, by weight of the composition, preferably from about 0.1% to about 8%, more preferably from about 0.1% to about 5%, most preferably from about 0.2% to about 3.5%, of

5 a conditioning agent suitable for application to the hair or skin. It is believed that the conditioning agent provides improved conditioning benefits to the hair, particularly clean hair feel and wet rinse feel.

10 The conditioning agent comprises a water insoluble, water dispersible, non-volatile, liquid that forms emulsified, liquid particles or are solubilized by the surfactant micelles, in the anionic deterative surfactant component (described above). Suitable conditioning agents for use in the shampoo composition are those conditioning agents characterized generally as silicones (e.g. silicone oils, 15 cationic silicones, silicone gums, high refractive silicones, and silicone resins), organic conditioning oils (e.g. hydrocarbon oils, polyolefins, and fatty esters) or combinations thereof, or those conditioning agents which otherwise form liquid, dispersed, particles in the aqueous surfactant matrix herein. Such conditioning agents should be physically and chemically compatible with the essential components of 20 the composition, and should not otherwise unduly impair product stability, aesthetics or performance.

The concentration of the conditioning agent in the shampoo composition should be sufficient 25 to provide the desired conditioning benefits, and as will be apparent to one of ordinary skill in the art. Such concentration can vary with the conditioning agent, the conditioning performance desired, the average size of the conditioning agent particles, the type and concentration of other components, and other like factors.

30 I. Silicones

The conditioning agent of the anti-dandruff and conditioning shampoo compositions of the present invention is preferably an insoluble silicone conditioning agent. The silicone conditioning agent 35 particles may comprise volatile silicone, non-volatile silicone, or combinations thereof. Preferred are non-volatile silicone conditioning agents. If volatile silicones are present, it will typically be incidental to their use as a solvent or carrier for commercially available forms of non-volatile silicone materials ingredients, such as silicone gums and resins. The silicone conditioning agent particles may comprise a 40 silicone fluid conditioning agent and may also comprise other ingredients, such as a silicone resin to improve silicone fluid deposition efficiency or enhance glossiness of the hair (especially when high refractive index (e.g. above about 1.46) silicone conditioning agents are used (e.g. highly phenylated silicones). 45

The concentration of the silicone conditioning agent typically ranges from about 0.01% to about 10%, by weight of the composition, preferably from about 0.1% to about 8%, more preferably 50 from about 0.1% to about 5%, most preferably from about 0.2% to about 3%. Non-limiting examples of suitable silicone conditioning agents, and optional suspending agents for the silicone, are described in U.S. Reissue Pat. No. 34,584, U.S. Pat. No. 5,104,646, and U.S. Pat. No. 5,106,609, which descriptions are incorporated herein by reference. The silicone conditioning agents for use in the anti- 55 dandruff and conditioning shampoo compositions of the present invention preferably have a viscosity, as measured at 25°C, from about 20 to about 2,000,000 centistokes ("csk"), more preferably from about

1,000 to about 1,800,000 csk, even more preferably from about 50,000 to about 1,500,000 csk, most preferably from about 100,000 to about 1,500,000 csk.

The dispersed, silicone conditioning agent particles typically have a number average particle diameter ranging from about 0.01 μ m to about 50 μ m. For small particle application to hair, the number average particle diameters typically range from about 0.01 μ m to about 4 μ m, preferably from about 0.01 μ m to about 2 μ m, more preferably from about 0.01 μ m to about 0.5 μ m. For larger particle application to hair, the number average particle diameters typically range from about 4 μ m to about 50 μ m, preferably from about 6 μ m to about 30 μ m, more preferably from about 9 μ m to about 20 μ m, most preferably from about 12 μ m to about 18 μ m. Conditioning agents having an average particle size of less than about 5 μ m may deposit more efficiently on the hair. It is believed that small size particles of conditioning agent are contained within the coacervate that is formed between the anionic surfactant component (described above) and the cationic polymer component (described below), upon dilution of the shampoo.

Background material on silicones including sections discussing silicone fluids, gums, and resins, as well as manufacture of silicones, are found in *Encyclopedia of Polymer Science and Engineering*, vol. 15, 2d ed., pp 204-308, John Wiley & Sons, Inc. (1989), incorporated herein by reference.

i. Silicone oils

Silicone fluids include silicone oils, which are flowable silicone materials having a viscosity, as measured at 25°C, less than 1,000,000 csk, preferably from about 5 csk to about 1,000,000 csk, more preferably from about 10 csk to about 100,000 csk. Suitable silicone oils for use in the anti-dandruff and conditioning shampoo compositions of the present invention include polyalkyl siloxanes, polyaryl siloxanes, polyalkylaryl siloxanes, polyether siloxane copolymers, and mixtures thereof. Other insoluble, non-volatile silicone fluids having hair conditioning properties may also be used.

Silicone oils include polyalkyl or polyaryl siloxanes which conform to the following Formula (III):

wherein **R** is aliphatic, preferably alkyl or alkenyl, or aryl, **R** can be substituted or unsubstituted, and **x** is an integer from 1 to about 8,000. Suitable unsubstituted **R** groups for use in the anti-dandruff and conditioning shampoo compositions of the present invention include, but are not limited to: alkoxy,

aryloxy, alkaryl, arylalkyl, arylalkenyl, alkamino, and ether-substituted, hydroxyl-substituted, and halogen-substituted aliphatic and aryl groups. Suitable R groups also include cationic amines and quaternary ammonium groups.

The aliphatic or aryl groups substituted on the siloxane chain may have any structure so long as the resulting silicones remain fluid at room temperature, are hydrophobic, are neither irritating, toxic nor otherwise harmful when applied to the hair, are compatible with the other components of the shampoo compositions, are chemically stable under normal use and storage conditions, are insoluble in the shampoo compositions herein, and are capable of being deposited on and conditioning the hair. The two R groups on the silicon atom of each monomeric silicone unit may represent the same or different groups. Preferably, the two R groups represent the same group.

Preferred alkyl and alkenyl substituents are C₁ to C₈ alkyls and alkenyls, more preferably from C₁ to C₄, most preferably from C₁ to C₂. The aliphatic portions of other alkyl-, alkenyl-, or alkynyl-containing groups (such as alkoxy, alkaryl, and alkamino) can be straight or branched chains, and are preferably from C₁ to C₈, more preferably from C₁ to C₄, even more preferably from C₁ to C₃, most preferably from C₁ to C₂. As discussed above, the R substituents can also contain amino functionalities (e.g. alkamino groups), which can be primary, secondary or tertiary amines or quaternary ammonium. These include mono-, di- and tri- alkylamino and alkoxyamino groups, wherein the aliphatic portion chain length is preferably as described above. The R substituents may also be substituted with other groups, such as halogens (e.g. chloride, fluoride, and bromide), halogenated aliphatic or aryl groups, hydroxy (e.g. hydroxy substituted aliphatic groups), and mixtures thereof. Suitable halogenated R groups could include, for example, tri-halogenated (preferably tri-fluoro) alkyl groups such as -R¹CF₃, wherein R¹ is a C₁ - C₃ alkyl. An example of such a polysiloxane includes, but is not limited to, polymethyl 3,3,3-trifluoropropylsiloxane.

Suitable R groups for use in the anti-dandruff and conditioning shampoo compositions of the present invention include, but are not limited to: methyl, ethyl, propyl, phenyl, methylphenyl and phenylmethyl. Specific non-limiting examples of preferred silicones include: polydimethyl siloxane, polydiethylsiloxane, and polymethylphenylsiloxane. Polydimethylsiloxane is especially preferred. Other suitable R groups include: methyl, methoxy, ethoxy, propoxy, and aryloxy. The three R groups on the end caps of the silicone may represent the same or different groups.

Non-volatile polyalkylsiloxane fluids that may be used include, for example, low molecular weight polydimethylsiloxanes. These siloxanes are available, for example, from the General Electric Company in their Viscasil R and SF 96 series, and from Dow Corning in their Dow Corning 200 series. Polyalkylaryl siloxane fluids that may be used, also include, for example, polymethylphenylsiloxanes. These siloxanes are available, for example, from the General Electric Company as SF 1075 methyl phenyl fluid or from Dow Corning as 556 Cosmetic Grade Fluid. Polyether siloxane copolymers that

may be used include, for example, a polypropylene oxide modified polydimethylsiloxane (e.g., Dow Corning DC-1248) although ethylene oxide or mixtures of ethylene oxide and propylene oxide may also be used. The ethylene oxide and polypropylene oxide concentrations must be sufficiently low to prevent solubility in water and the composition described herein.

Alkylamino substituted silicones suitable for use in the anti-dandruff and conditioning shampoo compositions of the present invention include, but are not limited to, those which conform to the following general Formula (IV):

wherein x and y are integers. This polymer is also known as "amodimethicone."

ii. Cationic silicones

Cationic silicone fluids suitable for use in the anti-dandruff and conditioning shampoo compositions of the present invention include, but are not limited to, those which conform to the general formula (V):

wherein G is hydrogen, phenyl, hydroxy, or C₁-C₈ alkyl, preferably methyl; a is 0 or an integer having a value from 1 to 3, preferably 0; b is 0 or 1, preferably 1; n is a number from 0 to 1,999, preferably from 49 to 149; m is an integer from 1 to 2,000, preferably from 1 to 10; the sum of n and m is a number from 1 to 2,000, preferably from 50 to 150; R₁ is a monovalent radical conforming to the general formula C_qH_{2q}L, wherein q is an integer having a value from 2 to 8 and L is selected from the following groups:

wherein R_2 is hydrogen, phenyl, benzyl, or a saturated hydrocarbon radical, preferably an alkyl radical from about C_1 to about C_{20} , and A^- is a halide ion.

An especially preferred cationic silicone corresponding to formula (V) is the polymer known as "trimethylsilylamodimethicone", which is shown below in formula (VI):

Other silicone cationic polymers which may be used in the anti-dandruff and conditioning shampoo compositions of the present invention are represented by the general formula (VII):

wherein R^3 is a monovalent hydrocarbon radical from C_1 to C_{18} , preferably an alkyl or alkenyl radical, such as methyl; R^4 is a hydrocarbon radical, preferably a C_1 to C_{18} alkylene radical or a C_{10} to C_{18} alkyleneoxy radical, more preferably a C_1 to C_8 alkyleneoxy radical; Q^- is a halide ion, preferably chloride; r is an average statistical value from 2 to 20, preferably from 2 to 8; s is an average statistical value from 20 to 200, preferably from 20 to 50. A preferred polymer of this class is known as UCARE SILICONE ALE 56™, available from Union Carbide.

iii. Silicone gums

Other silicone fluids suitable for use in the anti-dandruff and conditioning shampoo compositions of the present invention are the insoluble silicone gums. These gums are polyorganosiloxane materials having a viscosity, as measured at 25°C, of greater than or equal to 1,000,000 csk. Silicone gums are described in U.S. Pat. No. 4,152,416; Noll and Walter, *Chemistry and Technology of Silicones*, New York: Academic Press (1968); and in General Electric Silicone Rubber Product Data Sheets SE 30, SE 33, SE 54 and SE 76, all of which are incorporated herein by reference. The silicone gums will typically have a weight average molecular weight in excess of about 200,000, preferably from about 200,000 to about 1,000,000. Specific non-limiting examples of silicone gums for use in the anti-dandruff and conditioning shampoo compositions of the present invention include polydimethylsiloxane, (polydimethylsiloxane) (methylvinylsiloxane) copolymer, poly(dimethylsiloxane) (diphenyl siloxane)(methylvinylsiloxane) copolymer and mixtures thereof.

iv. High refractive index silicones

Other non-volatile, insoluble silicone fluid conditioning agents that are suitable for use in the anti-dandruff and conditioning shampoo compositions of the present invention are those known as "high refractive index silicones," having a refractive index of at least about 1.46, preferably at least about 1.48, more preferably at least about 1.52, most preferably at least about 1.55. The refractive index of the polysiloxane fluid will generally be less than about 1.70, typically less than about 1.60. In this context, polysiloxane "fluid" includes oils as well as gums.

The high refractive index polysiloxane fluid includes those represented by general Formula (III) above, as well as cyclic polysiloxanes such as those represented by Formula (VIII) below:

wherein **R** is as defined above, and **n** is a number from about 3 to about 7, preferably from about 3 to about 5.

The high refractive index polysiloxane fluids contain an amount of aryl-containing **R** substituents sufficient to increase the refractive index to the desired level, which is described above. Additionally, **R** and **n** must be selected so that the material is non-volatile.

Aryl-containing substituents include those which contain alicyclic and heterocyclic five and six member aryl rings and those which contain fused five or six member rings. The aryl rings

5 themselves can be substituted or unsubstituted. Substituents include aliphatic substituents, and may also include alkoxy substituents, acyl substituents, ketones, halogens (e.g., Cl and Br), amines, and the like. Examples of aryl-containing groups include, but are not limited to, substituted and unsubstituted
10 arenes, such as phenyl, and phenyl derivatives, such as phenyls with C₁-C₅ alkyl or alkenyl substituents. Specific non-limiting examples include: allylphenyl, methyl phenyl and ethyl phenyl, vinyl phenyls (e.g. styrenyl), and phenyl alkynes (e.g. phenyl C₂-C₄ alkynes). Heterocyclic aryl groups include, but are not limited to, substituents derived from furan, imidazole, pyrrole, pyridine, and the like. Examples
15 of fused aryl ring substituents include, but are not limited to, naphthalene, coumarin, and purine.

20 Generally, the high refractive index polysiloxane fluids will have a degree of aryl-containing substituents of at least about 15%, preferably at least about 20%, more preferably at least about 25%, even more preferably at least about 35%, most preferably at least about 50%. Typically, the degree of aryl substitution will be less than about 90%, more generally less than about 85%, preferably from about 55% to about 80%.

25 The high refractive index polysiloxane fluids are also characterized by relatively high surface tensions as a result of their aryl substitution. Generally, the polysiloxane fluids will have a surface tension of at least about 24 dynes/cm², typically at least about 27 dynes/cm². Surface tension, for purposes hereof, is measured by a de Nouy ring tensiometer according to Dow Corning Corporate Test Method CTM 0461 (23 November, 1971). Changes in surface tension can be measured according to
30 the above test method or according to ASTM Method D 1331.

35 Preferred high refractive index polysiloxane fluids have a combination of phenyl or phenyl derivative substituents (most preferably phenyl), with alkyl substituents, preferably C₁-C₄ alkyl (most preferably methyl), hydroxy, or C₁-C₄ alkylamino (especially -R¹NHR²NH₂ wherein each R¹ and R² independently is a C₁-C₃ alkyl, alkenyl, and/or alkoxy). High refractive index polysiloxanes are available from Dow Corning, Huls America, and General Electric.

40 When high refractive index silicones are used in the anti-dandruff and conditioning shampoo compositions of the present invention, they are preferably used in solution with a spreading agent, such as a silicone resin or a surfactant, to reduce the surface tension by a sufficient amount to enhance spreading and thereby enhance the glossiness (subsequent to drying) of hair treated with the compositions. Generally, an amount of the spreading agent is used that is sufficient to reduce the
45 surface tension of the high refractive index polysiloxane fluid by at least about 5%, preferably at least about 10%, more preferably at least about 15%, even more preferably at least about 20%, most preferably at least about 25%. Reductions in surface tension of the polysiloxane fluid/spreading agent
50 mixture may improve shine of the hair.
55

Also, the spreading agent will preferably reduce the surface tension by at least about 2 dynes/cm², preferably at least about 3 dynes/cm², even more preferably at least about 4 dynes/cm², most preferably at least about 5 dynes/cm².

The surface tension of the mixture of the polysiloxane fluid and the spreading agent, at the proportions present in the final product, is preferably less than or equal to about 30 dynes/cm², more preferably less than or equal to about 28 dynes/cm², most preferably less than or equal to about 25 dynes/cm². Typically, the surface tension will be in the range from about 15 dynes/cm² to about 30 dynes/cm², more typically from about 18 dynes/cm² to about 28 dynes/cm², and most generally from about 20 dynes/cm² to about 25 dynes/cm².

The weight ratio of the highly arylated polysiloxane fluid to the spreading agent will, in general, be from about 1000:1 to about 1:1, preferably from about 100:1 to about 2:1, more preferably from about 50:1 to about 2:1, most preferably from about 25:1 to about 2:1. When fluorinated surfactants are used, particularly high polysiloxane fluid to spreading agent ratios may be effective due to the efficiency of these surfactants. Thus, it is contemplated that ratios significantly above 1000:1 may be used.

Silicone fluids suitable for use in the anti-dandruff and conditioning shampoo compositions of the present invention are disclosed in U.S. Pat. No. 2,826,551, U.S. Pat. No. 3,964,500, U.S. Pat. No. 4,364,837, British Pat. No. 849,433, and *Silicon Compounds*, Petrarch Systems, Inc. (1984), all of which are incorporated herein by reference.

v. Silicone resins

Silicone resins may be included in the silicone conditioning agent of the anti-dandruff and conditioning shampoo compositions of the present invention. These resins are highly cross-linked polymeric siloxane systems. The cross-linking is introduced through the incorporation of trifunctional and tetrafunctional silanes with monofunctional or difunctional, or both, silanes during manufacture of the silicone resin. As is apparent to one of ordinary skill in the art, the degree of cross-linking that is required in order to result in a silicone resin will vary according to the specific silane units incorporated into the silicone resin. Generally, silicone materials which have a sufficient level of trifunctional and tetrafunctional siloxane monomer units (and hence, a sufficient level of cross-linking) such that they dry down to a rigid, or hard, film are considered to be silicone resins. The ratio of oxygen atoms to silicon atoms is indicative of the level of cross-linking in a particular silicone material. Silicone resins suitable for use in the anti-dandruff and conditioning shampoo compositions of the present invention generally have at least about 1.1 oxygen atoms per silicon atom. Preferably, the ratio of oxygen to silicon atoms is at least about 1.2:1.0. Silanes used in the manufacture of silicone resins include, but are not limited to: monomethyl-, dimethyl-, trimethyl-, monophenyl-, diphenyl-, methylphenyl-, monovinyl-, and methylvinyl-chlorosilanes, and tetrachlorosilane, with the methyl-substituted silanes

being most commonly utilized. Preferred resins are available from General Electric as GE SS4230 and GE SS4267. Commercially available silicone resins are generally supplied in a dissolved form in a low viscosity volatile or non-volatile silicone fluid. The silicone resins for use herein should be supplied and incorporated into the present compositions in such dissolved form, as will be readily apparent to one of ordinary skill in the art.

Silicone materials and silicone resins in particular, can conveniently be identified according to a shorthand nomenclature system known to those of ordinary skill in the art as "MDTQ" nomenclature. Under this system, the silicone is described according to presence of various siloxane monomer units which make up the silicone. Briefly, the symbol **M** denotes the monofunctional unit $(\text{CH}_3)_3\text{SiO}_{0.5}$; **D** denotes the difunctional unit $(\text{CH}_3)_2\text{SiO}$; **T** denotes the trifunctional unit $(\text{CH}_3)\text{SiO}_{1.5}$; and **Q** denotes the quadra- or tetra-functional unit SiO_2 . Primes of the unit symbols (e.g. **M'**, **D'**, **T'**, and **Q'**) denote substituents other than methyl, and must be specifically defined for each occurrence. Typical alternate substituents include, but are not limited to, groups such as vinyl, phenyls, amines, hydroxyls, and the like. The molar ratios of the various units, either in terms of subscripts to the symbols indicating the total number of each type of unit in the silicone (or an average thereof) or as specifically indicated ratios in combination with molecular weight complete the description of the silicone material under the MDTQ system. Higher relative molar amounts of **T**, **Q**, **T'** and/or **Q'** to **D**, **D'**, **M** and/or **M'** in a silicone resin indicates higher levels of cross-linking. As discussed above, however, the overall level of cross-linking can also be indicated by the oxygen to silicon ratio.

Preferred silicone resins for use in the anti-dandruff and conditioning shampoo compositions of the present invention include, but are not limited to **MQ**, **MT**, **MTQ**, **MDT** and **MDTQ** resins. Methyl is a preferred silicone substituent. Especially preferred silicone resins are **MQ** resins, wherein the **M:Q** ratio is from about 0.5:1.0 to about 1.5:1.0 and the average molecular weight of the silicone resin is from about 1000 to about 10,000.

The weight ratio of the non-volatile silicone fluid, having refractive index below 1.46, to the silicone resin component, when used, is preferably from about 4:1 to about 400:1, more preferably from about 9:1 to about 200:1, most preferably from about 19:1 to about 100:1, particularly when the silicone fluid component is a polydimethylsiloxane fluid or a mixture of polydimethylsiloxane fluid and polydimethylsiloxane gum as described above. Insofar as the silicone resin forms a part of the same phase in the compositions hereof as the silicone fluid, i.e. the conditioning active, the sum of the fluid and resin should be included in determining the level of silicone conditioning agent in the composition.

2. Organic conditioning oils

The conditioning component of the anti-dandruff and conditioning shampoo compositions of the present invention may also comprise from about 0.05% to about 3%, by weight of the composition, preferably from about 0.08% to about 1.5%, more preferably from about 0.1% to about 1%, of at least

one organic conditioning oil as the conditioning agent, either alone or in combination with other conditioning agents, such as the silicones (described above).

It is believed that these organic conditioning oils provide the shampoo composition with improved conditioning performance when used in combination with the essential components of the composition, and in particular when used in combination with cationic polymers (described below). The conditioning oils may add shine and luster to the hair. Additionally, they may enhance dry combing and dry hair feel. Most or all of these organic conditioning oils are believed to be solubilized in the surfactant micelles of the shampoo composition. It is also believed that this solubilization into the surfactant micelles contributes to the improved hair conditioning performance of the shampoo compositions herein.

The organic conditioning oils suitable for use as the conditioning agent herein are preferably low viscosity, water insoluble, liquids selected from the hydrocarbon oils, polyolefins, fatty esters, and mixtures thereof. The viscosity, as measured at 40°C, of such organic conditioning oils is preferably from about 1 centipoise to about 200 centipoise, more preferably from about 1 centipoise to about 100 centipoise, most preferably from about 2 centipoise to about 50 centipoise.

i. Hydrocarbon oils

Suitable organic conditioning oils for use as conditioning agents in the anti-dandruff and conditioning shampoo compositions of the present invention include, but are not limited to, hydrocarbon oils having at least about 10 carbon atoms, such as cyclic hydrocarbons, straight chain aliphatic hydrocarbons (saturated or unsaturated), and branched chain aliphatic hydrocarbons (saturated or unsaturated), including polymers and mixtures thereof. Straight chain hydrocarbon oils preferably are from about C₁₂ to about C₁₉. Branched chain hydrocarbon oils, including hydrocarbon polymers, typically will contain more than 19 carbon atoms.

Specific non-limiting examples of these hydrocarbon oils include paraffin oil, mineral oil, saturated and unsaturated dodecane, saturated and unsaturated tridecane, saturated and unsaturated tetradecane, saturated and unsaturated pentadecane, saturated and unsaturated hexadecane, polybutene, polydecene, and mixtures thereof. Branched-chain isomers of these compounds, as well as of higher chain length hydrocarbons, can also be used, examples of which include highly branched, saturated or unsaturated, alkanes such as the permethyl-substituted isomers, e.g., the permethyl-substituted isomers of hexadecane and eicosane, such as 2, 2, 4, 4, 6, 6, 8, 8-dimethyl-10-methylundecane and 2, 2, 4, 4, 6, 6-dimethyl-8-methylnonane, available from Permethyl Corporation. Hydrocarbon polymers such as polybutene and polydecene. A preferred hydrocarbon polymer is polybutene, such as the copolymer of isobutylene and butene. A commercially available material of this type is L-14 polybutene from Amoco Chemical Corporation.

ii. Polyolefins

Organic conditioning oils for use in the anti-dandruff and conditioning shampoo compositions of the present invention can also include liquid polyolefins, more preferably liquid poly- α -olefins, most preferably hydrogenated liquid poly- α -olefins. Polyolefins for use herein are prepared by polymerization of C_4 to about C_{14} olefinic monomers, preferably from about C_6 to about C_{12} .

Non-limiting examples of olefinic monomers for use in preparing the polyolefin liquids herein include ethylene, propylene, 1-butene, 1-pentene, 1-hexene, 1-octene, 1-decene, 1-dodecene, 1-tetradecene, branched chain isomers such as 4-methyl-1-pentene, and mixtures thereof. Also suitable for preparing the polyolefin liquids are olefin-containing refinery feedstocks or effluents. Preferred hydrogenated α -olefin monomers include, but are not limited to: 1-hexene to 1-hexadecenes, 1-octene to 1-tetradecene, and mixtures thereof.

iii. Fatty Esters

Other suitable organic conditioning oils for use as the conditioning agent in the anti-dandruff and conditioning shampoo compositions of the present invention include, but are not limited to, fatty esters having at least 10 carbon atoms. These fatty esters include esters with hydrocarbyl chains derived from fatty acids or alcohols (e.g. mono-esters, polyhydric alcohol esters, and di- and tri-carboxylic acid esters). The hydrocarbyl radicals of the fatty esters hereof may include or have covalently bonded thereto other compatible functionalities, such as amides and alkoxy moieties (e.g., ethoxy or ether linkages, etc.).

Suitable for use in the anti-dandruff and conditioning shampoo compositions of the present invention are alkyl and alkenyl esters of fatty acids having from about C_{10} to about C_{22} aliphatic chains, and alkyl and alkenyl fatty alcohol carboxylic acid esters having a C_{10} to about C_{22} alkyl and/or alkenyl alcohol-derived aliphatic chain, and mixtures thereof. Specific examples of preferred fatty esters include, but are not limited to: isopropyl isostearate, hexyl laurate, isohexyl laurate, isohexyl palmitate, isopropyl palmitate, decyl oleate, isodecyl oleate, hexadecyl stearate, decyl stearate, isopropyl isostearate, dihexyldecyl adipate, lauryl lactate, myristyl lactate, cetyl lactate, oleyl stearate, oleyl oleate, oleyl myristate, lauryl acetate, cetyl propionate, and oleyl adipate.

Other fatty esters suitable for use in the anti-dandruff and conditioning shampoo compositions of the present invention are mono-carboxylic acid esters of the general formula $R'COOR$, wherein R' and R are alkyl or alkenyl radicals, and the sum of carbon atoms in R' and R is at least 10, preferably at least 20. The mono-carboxylic acid ester need not necessarily contain at least one chain with at least 10 carbon atoms; rather the total number of aliphatic chain carbon atoms must be least 10. Specific non-limiting examples of mono-carboxylic acid esters include: isopropyl myristate, glycol stearate, and isopropyl laurate.

Still other fatty esters suitable for use in the anti-dandruff and conditioning shampoo compositions of the present invention are di- and tri-alkyl and alkenyl esters of carboxylic acids, such as esters of C₄ to C₈ dicarboxylic acids (e.g. C₁ to C₂₂ esters, preferably C₁ to C₆, of succinic acid, glutaric acid, adipic acid, hexanoic acid, heptanoic acid, and octanoic acid). Specific non-limiting examples of di- and tri- alkyl and alkenyl esters of carboxylic acids include isocetyl stearyl stearate, diisopropyl adipate, and tristearyl citrate.

Other fatty esters suitable for use in the anti-dandruff and conditioning shampoo compositions of the present invention are those known as polyhydric alcohol esters. Such polyhydric alcohol esters include alkylene glycol esters, such as ethylene glycol mono and di-fatty acid esters, diethylene glycol mono- and di-fatty acid esters, polyethylene glycol mono- and di-fatty acid esters, propylene glycol mono- and di-fatty acid esters, polypropylene glycol monooleate, polypropylene glycol 2000 monostearate, ethoxylated propylene glycol monostearate, glyceryl mono- and di-fatty acid esters, polyglycerol poly-fatty acid esters, ethoxylated glyceryl monostearate, 1,3-butylene glycol monostearate, 1,3-butylene glycol distearate, polyoxyethylene polyol fatty acid ester, sorbitan fatty acid esters, and polyoxyethylene sorbitan fatty acid esters.

Still other fatty esters suitable for use in the anti-dandruff and conditioning shampoo compositions of the present invention are glycerides, including, but not limited to, mono-, di-, and tri-glycerides, preferably di- and tri-glycerides, most preferably triglycerides. For use in the shampoo compositions described herein, the glycerides are preferably the mono-, di-, and tri-esters of glycerol and long chain carboxylic acids, such as C₁₀ to C₂₂ carboxylic acids. A variety of these types of materials can be obtained from vegetable and animal fats and oils, such as castor oil, safflower oil, cottonseed oil, corn oil, olive oil, cod liver oil, almond oil, avocado oil, palm oil, sesame oil, lanolin and soybean oil. Synthetic oils include, but are not limited to, triolein and tristearin glyceryl dilaurate.

Other fatty esters suitable for use in the anti-dandruff and conditioning shampoo compositions of the present invention are water insoluble synthetic fatty esters. Some preferred synthetic esters conform to the general Formula (IX):

wherein R¹ is a C₇ to C₉ alkyl, alkenyl, hydroxyalkyl or hydroxyalkenyl group, preferably a saturated alkyl group, more preferably a saturated, linear, alkyl group; n is a positive integer having a value from 2 to 4, preferably 3; and Y is an alkyl, alkenyl, hydroxy or carboxy substituted alkyl or alkenyl, having

from about 2 to about 20 carbon atoms, preferably from about 3 to about 14 carbon atoms. Other preferred synthetic esters conform to the general Formula (X):

wherein R^2 is a C_8 to C_{10} alkyl, alkenyl, hydroxyalkyl or hydroxyalkenyl group; preferably a saturated alkyl group, more preferably a saturated, linear, alkyl group; n and Y are as defined above in Formula (X).

It is believed that the preferred synthetic esters provide improved wet hair feel when used in combination with the essential components of the shampoo compositions of the present invention, particularly when used in combination with the cationic polymer component (described below). These synthetic esters improve wet hair feel by reducing the slimy or excessively conditioned feel of wet hair that has been conditioned by a cationic polymer.

Specific non-limiting examples of suitable synthetic fatty esters for use in the anti-dandruff and conditioning shampoo compositions of the present invention include: P-43 (C_8 - C_{10} triester of trimethylolpropane), MCP-684 (tetraester of 3,3 diethanol-1,5 pentadiol), MCP 121 (C_8 - C_{10} diester of adipic acid), all of which are available from Mobil Chemical Company.

3. Other conditioning agents

Also suitable for use in the compositions herein are the conditioning agents described by the Procter & Gamble Company in U.S. Pat. Nos. 5,674,478, and 5,750,122, both of which are incorporated herein in their entirety by reference. Also suitable for use herein are those conditioning agents described in U.S. Pat. Nos. 4,529,586 (Clairol), 4,507,280 (Clairol), 4,663,158 (Clairol), 4,197,865 (L'Oreal), 4,217,914 (L'Oreal), 4,381,919 (L'Oreal), and 4,422,853 (L'Oreal), all of which descriptions are incorporated herein by reference.

Some other preferred silicone conditioning agents for use in the compositions of the present invention include: Abil® S 201 (dimethicone/sodium PG-propyldimethicone thiosulfate copolymer), available from Goldschmidt; DC Q2-8220 (trimethylsilyl amodimethicone) available from Dow Corning; DC 949 (amodimethicone, cetrimonium chloride, and Trideceth-12), available from Dow Corning; DC 749 (cyclomethicone and trimethylsiloxysilicate), available from Dow Corning; DC2502 (cetyl dimethicone), available from Dow Corning; BC97/004 and BC 99/088 (amino functionalized silicone microemulsions), available from Basildon Chemicals; GE SME253 and SM2115-D2 and SM2658 and SF1708 (amino functionalized silicone microemulsions), available from General Electric;

5
10
15
siliconized meadowfoam seed oil, available from Croda; and those silicone conditioning agents described by GAF Corp. in U.S. Pat. No. 4,834,767 (quaternized amino lactam), by Biosil Technologies in U.S. Pat. No. 5,854,319 (reactive silicone emulsions containing amino acids), and by Dow Corning in U.S. Pat. No. 4,898,585 (polysiloxanes), all of which descriptions are incorporated herein by reference.

20
25
30
C. Anti-dandruff agent

The anti-dandruff and conditioning shampoo compositions of the present invention comprise from about 0.1% to about 4%, by weight of the composition, preferably from about 0.1% to about 3%, most preferably from about 0.3% to about 2%, of an anti-dandruff agent suitable for application to the hair or skin. The anti-dandruff agent provides the shampoo compositions with anti-microbial activity. The anti-dandruff agent may be particulate or soluble. Suitable, non-limiting examples of particulate anti-dandruff agents include: pyridinethione salts, selenium sulfide, particulate sulfur, and mixtures thereof. Preferred are pyridinethione salts. A suitable, non-limiting example of a soluble anti-dandruff agents is ketoconazole. Such anti-dandruff agent should be physically and chemically compatible with the essential components of the composition, and should not otherwise unduly impair product stability, aesthetics or performance.

35
40
45
I. Pyridinethione salts

Pyridinethione anti-dandruff particulates, especially 1-hydroxy-2-pyridinethione salts, are highly preferred particulate anti-dandruff agents for use in the anti-dandruff and conditioning shampoo compositions of the present invention. The concentration of pyridinethione anti-dandruff particulate typically ranges from about 0.1% to about 4%, by weight of the composition, preferably from about 0.1% to about 3%, most preferably from about 0.3% to about 2%. Preferred pyridinethione salts include those formed from heavy metals such as zinc, tin, cadmium, magnesium, aluminum and zirconium, preferably zinc, more preferably the zinc salt of 1-hydroxy-2-pyridinethione (known as "zinc pyridinethione" or "ZPT"), most preferably 1-hydroxy-2-pyridinethione salts in platelet particle form, wherein the particles have an average size of up to about 20 μ , preferably up to about 5 μ , most preferably up to about 2.5 μ . Salts formed from other cations, such as sodium, may also be suitable. Pyridinethione anti-dandruff agents are described, for example, in U.S. Pat. No. 2,809,971; U.S. Pat. No. 3,236,733; U.S. Pat. No. 3,753,196; U.S. Pat. No. 3,761,418; U.S. Pat. No. 4,345,080; U.S. Pat. No. 4,323,683; U.S. Pat. No. 4,379,753; and U.S. Pat. No. 4,470,982, all of which are incorporated herein by reference. It is contemplated that when ZPT is used as the anti-dandruff particulate in the shampoo compositions herein, that the growth or re-growth of hair may be stimulated or regulated, or both, or that hair loss may be reduced or inhibited, or that hair may appear thicker or fuller.

5

2. Selenium sulfide

10 Selenium sulfide is a particulate anti-dandruff agent suitable for use in the anti-dandruff and conditioning shampoo compositions of the present invention, effective concentrations of which range from about 0.1% to about 4%, by weight of the composition, preferably from about 0.3% to about 2.5%, more preferably from about 0.5% to about 1.5%. Selenium sulfide is generally regarded as a
15 compound having one mole of selenium and two moles of sulfur, although it may also be a cyclic structure that conforms to the general formula Se_xS_y , wherein $x + y = 8$. Average particle diameters for the selenium sulfide are typically less than $15\mu m$, as measured by forward laser light scattering device (e.g. Malvern 3600 instrument), preferably less than $10\mu m$. Selenium sulfide compounds are
20 described, for example, in U.S. Pat. No. 2,694,668; U.S. Pat. No. 3,152,046; U.S. Pat. No. 4,089,945; and U.S. Pat. No. 4,885,107, all of which descriptions are incorporated herein by reference.

3. Sulfur

25 Sulfur may also be used as the particulate anti-dandruff agent in the anti-dandruff and conditioning shampoo compositions of the present invention. Effective concentrations of the particulate sulfur are typically from about 1% to about 4%, by weight of the composition, preferably from about 2% to about 4%.

4. Ketoconazole

30 Ketoconazole may also be used as the soluble anti-dandruff agent in the anti-dandruff and conditioning shampoo compositions of the present invention. Effective concentrations of ketoconazole are typically from about 0.1% to about 4%, by weight of the composition, preferably from about 0.3% to about 2%.

D. Cationic polymer

40 The anti-dandruff and conditioning shampoo compositions of the present invention comprise from about 0.02% to about 5%, by weight of the composition, preferably from about 0.05% to about 3%, more preferably from about 0.1% to about 2%, most preferably from about 0.5% to about 1%, of at
45 least one organic, cationic deposition and conditioning polymer suitable for application to the hair or skin. The cationic polymers are believed to provide increased anti-dandruff efficacy and increased conditioning to the shampoo compositions described herein. Such cationic polymers should be
50 physically and chemically compatible with the essential components described herein, and should not otherwise unduly impair product stability, aesthetics or performance.

1. Characteristics of the cationic polymers

55 The cationic polymers useful in the present invention must be selected and must be present at a level such that the cationic polymers are soluble in the shampoo composition, and which are preferably soluble in a complex coacervate phase in the shampoo composition, upon dilution. Such coacervate is

described in detail below. Also, physical properties of the cationic polymers and suitable counterions are detailed.

i. Coacervate formed from cationic polymer

A coacervate is formed, upon dilution of the shampoo composition, between the cationic polymer and the anionic deterative surfactant component (described above) of the present invention. It is believed that the cationic moiety of the polymer binds with the anionic moiety of the surfactant to form an insoluble complex that precipitates, upon dilution (the coacervate). Complex coacervates of the cationic polymer can also be formed with other optional anionic components of the shampoo composition (described below). Coacervate formation is dependent upon a variety of criteria, such as molecular weight, component concentration, and ratio of interacting ionic components, ionic strength (including modification of ionic strength, for example, by addition of salts), charge density of the cationic and anionic components, pH, and temperature. Coacervate systems and the effect of these parameters have been described, for example, in J. Caelles, et al., "Anionic and Cationic Compounds in Mixed Systems", *Cosmetics & Toiletries*, vol. 106, (April 1991), pp 49-54; C. J. van Oss, "Coacervation, Complex-Coacervation and Flocculation", *J. Dispersion Science and Tech.*, vol. 9 (5.6), (1988-89), pp 561-73; and in D. J. Burgess, "Practical Analysis of Complex Coacervate Systems", *J. of Colloid and Interface Science*, vol. 140, no. 1, (November 1990), pp 227-38; all of which descriptions are incorporated herein by reference. The shampoo compositions described herein, typically have a ratio of anionic deterative surfactant component to cationic polymer component from about 25 : 0.02 to about 1 : 1, preferably from about 20 : 0.1 to about 12 : 1.

Coacervates are believed to provide conditioning benefits, especially conditioning benefits during product use when the hair is wet, by helping to deposit conditioning agents onto the hair and scalp. Coacervates are also known in the art to aid deposition of other types of particulates. This is thought to occur by concentrating particulates within coacervate boundaries upon dilution.

It has also been found that the characteristics of polymer in such compositions can affect the bioavailability/coverage of anti-dandruff particulates, such characteristics include cationic guar polymer molecular weight and charge density. Guars with lower molecular weight are preferred, guars with lower charge density are preferred. Guars with lower molecular weight and lower charge density are highly preferred. It is believed that these select guars impart modified physical properties (i.e. rheology) to the coacervates formed.

Techniques for analysis of formation of complex coacervates are known in the art. For example, microscopic analyses of the shampoo compositions, at any chosen stage of dilution, can be utilized to identify whether a coacervate phase has formed. Such coacervate phase will be identifiable as an additional emulsified phase in the composition. The use of dyes can aid in distinguishing the coacervate phase from other insoluble phases dispersed in the shampoo composition.

5

ii. Physical properties of the cationic polymer

The average molecular weight of cationic conditioning polymers suitable for use herein is typically from about 5,000 to about 10,000,000, preferably from about 100,000 to about 2,000,000, more preferably from about 200,000 to about 1,500,000, more preferably from about 250,000 to about 850,000, more preferably from about 350,000 to about 500,000. The polymers have a cationic charge density typically from about 0.1 meq/g to about 7 meq/g, as measured at the pH of intended use of the shampoo composition, preferably from about 0.2 meq/g to about 5 meq/g, preferably from about 0.5 meq/gm to about 2 meq/g, more preferably from about 0.6 meq/g to about 1 meq/g, more preferably from about 0.6 meq/g to about 0.9 meq/g. The pH of intended use of the shampoo composition typically ranges from about pH 3 to about pH 9, preferably from about pH 4 to about pH 7.

iii. Counterions used in forming cationic polymer

Any anionic counterions may be use in association with the cationic polymers so long as the cationic polymers remain soluble in water, in the shampoo composition, or in a coacervate phase of the shampoo composition, and so long as the counterions are physically and chemically compatible with the essential components of the shampoo composition or do not otherwise unduly impair product performance, stability or aesthetics. Non-limiting examples of such counterions include: halides (e.g., chloride, fluoride, bromide, iodide), sulfate, methylsulfate, and mixtures thereof.

2. Types cationic polymers

Examples of cationic polymers which may be suitably employed in the shampoo compositions herein include, but are not limited to cationic polysaccharides (e.g. cationic cellulose derivatives and cationic guar), copolymers of vinyl monomers, vinyl pyrrolidone copolymers, cationic modified proteins, and certain polymeric quaternary salts. Such cationic polymers are described in detail below.

i. Cationic polysaccharides

Preferred cationic polymers for use in the anti-dandruff and conditioning shampoo compositions of the present invention are those known as cationic polysaccharides. Cationic polysaccharides are those polymers based on C₅ to C₆ sugars and derivatives which have been made cationic by engrafting of cationic moieties on the polysaccharide backbone, and include homopolymers, copolymers, terpolymers, and so forth, of quaternary ammonium or cationic amine-substituted monomer units, optionally in combination with non-cationic monomers. The polysaccharides may be composed of one type of sugar or of more than one type. The cationic amines can be primary, secondary, or tertiary amines (preferably secondary or tertiary), depending upon the particular species and the selected pH of the shampoo composition. The monomers may be in straight chain or branched chain geometric arrangements. All of the monomer units may have cationic nitrogen-containing moieties attached thereto, preferably some of the monomer units do not have such moieties attached. Non-limiting examples of cationic polysaccharides are described in the *CTFA Cosmetic Ingredient Dictionary*, 3d

ed., edited by Estrin, Crosley, and Haynes. (The Cosmetic, Toiletry, and Fragrance Association, Inc., Washington, D.C. (1982), which description is incorporated herein by reference.

Cationic polysaccharide polymers include the following: cationic celluloses and hydroxyethylcelluloses; cationic starches and hydroxyalkyl starches; cationic polymers based on the galactomannan copolymer known as guar gum obtained from the endosperm of the guar bean; cationic polymers based on arabinose vegetable gums; cationic polymers derived from xylose polymers (such as those found in wood, straw, cottonseed hulls, and corn cobs); cationic polymers derived from fucose polymers (such as those found as a component of cell walls in seaweed); cationic polymers derived from fructose polymers (such as Inulin, which is found in certain plants); cationic polymers based on acid-containing sugars (such as galacturonic acid and glucouronic acid); cationic polymers based on amine sugars (such as galactosamine and glucosamine); cationic polymers based on 5 and 6 member ring polyalcohols; cationic polymers based on galactose monomers (such as those found in plant gums and mucilates); and cationic polymers based on mannose monomers (such as those found in plants, yeasts, and red algae). Preferred are cationic celluloses and hydroxyethylcelluloses; cationic starches and hydroxyalkyl starches; cationic polymers based on guar gum, and mixtures thereof.

a. Cationic cellulose derivatives

Suitable polysaccharide cationic polymers for use in the anti-dandruff and conditioning shampoo compositions of the present invention are the cationic cellulose derivatives and cationic starch derivatives. Such cationic polymers include those which conform to the general Formula (XI):

wherein **A** is an anhydroglucose residual group (e.g. a starch or cellulose anhydroglucose residual); **R** is an alkylene oxyalkylene, polyoxyalkylene, or hydroxyalkylene group, or combination thereof; **R¹**, **R²**, and **R³** are independently alkyl, aryl, alkylaryl, arylalkyl, alkoxyalkyl, or alkoxyaryl groups, each group containing up to about 18 carbon atoms, and the total number of carbon atoms for each cationic moiety (i.e., the sum of carbon atoms in **R¹**, **R²**, and **R³**) preferably being about 20 or less; and **X** is an anionic counterion as described above.

Preferred cationic cellulose polymers include, but are not limited to, those polymers available from Amerchol Corporation, in their Polymer JR and LR series of polymers, as salts of hydroxyethyl cellulose reacted with trimethyl ammonium substituted epoxide, known in the industry (CTFA) as Polyquaternium 10 (e.g. JR 30M®, available from Amerchol Corporation). Preferred Polyquaternium

10 polymers for use herein, typically have a charge density from about 0.3 meq/g to about 3 meq/g and a molecular weight from about 200,000 to about 1,500,000. Another non-limiting of a preferred type of cationic cellulose includes the polymeric quaternary ammonium salt of hydroxyethyl cellulose reacted with lauryl dimethyl ammonium-substituted epoxide, known in the industry (CTFA) as Polyquaternium 24, (e.g. Polymer LM 200®, available from Amerchol Corporation).

Also suitable for use herein are those quaternary nitrogen-containing cellulose copolymers of hydroxyethylcellulose reacted with diallyldimethyl ammonium chloride, known in the industry (CTFA) as Polyquaternium 4 (e.g. Celquat® H-100, available from National Starch Corporation). Quaternary nitrogen-containing cellulose ethers suitable for use herein are described in U.S. Pat. No. 3,962,418, and still other copolymers of etherified cellulose and starch suitable for use herein are described in U.S. Pat. No. 3,958,581, both of which descriptions are incorporated herein by reference.

b. Cationic guar derivatives

Other suitable polysaccharide cationic polymers for use in the anti-dandruff and conditioning shampoo compositions of the present invention are cationic guar polymers. Guars are cationically substituted galactomannan (guar) gum derivatives. The molecular weight of such derivatives ranges typically from about 50,000 to about 2,500,000, preferably from about 50,000 to about 1,000,000, more preferably from about 50,000 to about 700,000, more preferably from about 100,000 to about 350,000.

Guar gum for use in preparing these guar gum derivatives is typically obtained as a naturally occurring material from the seeds of the guar plant. The guar molecule itself is a straight chain mannan branched at regular intervals with single membered galactose units on alternative mannose units. The mannose units are linked to each other by means of β (1-4) glycosidic linkages. The galactose branching arises by way of an α (1-6) linkage. Cationic derivatives of the guar gums are obtained by reaction between the hydroxyl groups of the polygalactomannan and reactive quaternary ammonium compounds. The degree of substitution of the cationic groups onto the guar structure must be sufficient to provide the requisite cationic charge density described above.

Suitable quaternary ammonium compounds for use in forming the cationic guar polymers include those conforming to the general Formula (XII):

wherein where R^1 , R^2 and R^3 are methyl or ethyl groups; R^4 is either an epoxyalkyl group of the general Formula (XIII):

or R^4 is a halohydrin group of the general Formula (XIV):

wherein R^5 is a C_1 to C_3 alkylene; X is chlorine or bromine, and Z is an anion such as Cl^- , Br^- , I^- or HSO_4^- .

Cationic guar polymers (cationic derivatives of guar gum) formed from the reagents described above are represented by the general Formula (XV):

wherein R is guar gum. Preferably, the cationic guar polymer is guar hydroxypropyltrimethylammonium chloride, which can be more specifically represented by the general Formula (XVI):

Specific non-limiting examples of cationic guar polymers which conform to Formula XVI include: Jaguar® C 13S, having a cationic charge density of 0.8meq/g (available from Rhodia Company) and Jaguar® C 17, having a cationic charge density of 1.6meq/g (available from Rhodia Company). Other suitable cationic guar polymers include hydroxypropylated cationic guar derivatives. Still other suitable cationic polymers include copolymers of etherified guar, some examples of which are described in U.S. Pat. No. 3,958,581, which description is incorporated herein by reference.

5

ii. Copolymers of vinyl monomers

Other suitable cationic polymers for use in the anti-dandruff and conditioning shampoo compositions of the present invention are copolymers of vinyl monomers, having cationic protonated amine or quaternary ammonium functionalities, reacted with water soluble monomers. Non-limiting examples of such monomers include: acrylamide, methacrylamide, alkyl and dialkyl acrylamides, alkyl and dialkyl methacrylamides, alkyl acrylate, alkyl methacrylate, vinyl caprolactone, vinyl pyrrolidone, and mixtures thereof. The alkyl and dialkyl substituted monomers preferably have from C₁ to C₇ alkyl groups, more preferably from C₁ to C₃ alkyl groups. Other suitable monomers include vinyl esters, vinyl alcohol (made by hydrolysis of polyvinyl acetate), maleic anhydride, propylene glycol, ethylene glycol, and mixtures thereof.

Suitable cationic protonated amino and quaternary ammonium monomers, for inclusion in the cationic polymers of the shampoo composition herein, include vinyl compounds substituted with dialkylaminoalkyl acrylate, dialkylaminoalkyl methacrylate, monoalkylaminoalkyl acrylate, monoalkylaminoalkyl methacrylate, trialkyl methacryloxyalkyl ammonium salt, trialkyl acryloxyalkyl ammonium salt, diallyl quaternary ammonium salts; and vinyl quaternary ammonium monomers having cyclic cationic nitrogen-containing rings such as pyridinium, imidazolium, and quaternized pyrrolidones, such as alkyl vinyl imidazolium, alkyl vinyl pyridinium, and alkyl vinyl pyrrolidone salts. The alkyl portions of these monomers are preferably lower alkyls such as the C₁ - C₃ alkyls.

Suitable amine-substituted vinyl monomers for use herein include, dialkylaminoalkyl acrylamide, and dialkylaminoalkyl methacrylamide, wherein the alkyl groups are preferably C₁ to C₇ hydrocarbyls, more preferably C₁ to C₃ alkyls.

iii. Vinyl pyrrolidone copolymers

Other suitable cationic polymers for use in the anti-dandruff and conditioning shampoo compositions of the present invention include: copolymers of 1-vinyl-2-pyrrolidone and 1-vinyl-3-methylimidazolium salt (e.g., chloride salt), known in the industry (CTFA) as Polyquaternium 16 (e.g. Luviquat® FC 370, available from BASF Wyandotte Corporation); copolymers of 1-vinyl-2-pyrrolidone and dimethylaminoethyl methacrylate, known in the industry (CTFA) as Polyquaternium 11 (e.g. Gafquat® 755N, available from ISP Corporation); cationic diallyl quaternary ammonium-containing polymers, including, for example, dimethyldiallylammonium chloride homopolymer, known in the industry (CTFA) as Polyquaternium 6; copolymers of acrylamide and dimethyldiallylammonium chloride, known in the industry (CTFA) as Polyquaternium 7; and mineral acid salts of amino-alkyl esters of homopolymers and copolymers of unsaturated C₃ to C₅ carboxylic acids, such as those described in U.S. Pat. No. 4,009,256, which description is incorporated herein by reference.

iv. Cationic modified proteins and polymeric quaternary salts

Still other cationic polymers for use in the anti-dandruff and conditioning shampoo compositions of the present invention are cationic modified proteins, such as lauryldimonium hydroxypropyl collagen (e.g. Croquat® L, available from Croda Corporation), or cocodimonium hydroxypropyl hydrolyzed hair keratin (e.g. Croquat® HH, available from Croda Corporation). Other cationic polymers include the polymeric quaternary salt prepared the reaction of adipic acid and dimethylaminopropylamine, reacted with dichloroethyl ether, known in the industry (CTFA) as Polyquaternium 2 (e.g. Mirapol® AD-1, available from Rhodia), and the polymeric quaternary salt prepared by the reaction of azelaic acid and dimethylaminopropylether, known in the industry (CTFA) as Polyquaternium 18 (e.g. Mirapol® AZ-1, available from Rhodia Corporation).

v. Other cationic polymers

Yet other cationic polymers suitable for use herein are the Arquad® series of quaternary ammonium salts, available from Akzo Nobel. Other preferred cationic polymers for use herein include: Polymer KG30M (polyquaternium 10 and quaternized cellulose), Incroquat® behenyl trimonium methosulfate (cetearyl alcohol and behentrimonium methosulfate), available from Croda; Merquat® 5 (quaternary ammonium resin), available from Calgon; Gafquat® series 440 (cationic quaternized copolymers), available from ISP; Akypoquat® 131, available from Kao; Salcare® SC 60 (quaternary ammonium resin), or Salcare® SC95 or SC96 (cationic liquid dispersion thickeners), all available from Ciba; and Meadowquat® HG (PEG-2-dimeadowfoamamido-ethylmonium methosulfate), available from Fanning.

E. Water

The anti-dandruff and conditioning shampoo compositions of the present invention comprise from about 20% to about 94.75%, by weight of the composition, preferably from about 50% to about 94.75%, more preferably from about 60% to about 85%, of water.

II. Optional Components

The anti-dandruff and conditioning shampoo compositions of the present invention may, in some embodiments, further comprise additional optional components known or otherwise effective for use in hair care or personal care products. Additional surfactants, suspending agents, polyalkylene glycols, hair growth regulating agents, and other optional components are described in detail below.

A. Other surfactants

The anti-dandruff and conditioning shampoo compositions of the present invention may, in some embodiments, further comprise from about 0.5% to about 25%, by weight of the composition, preferably from about 1% to about 20%, most preferably from about 1% to about 10%, of a surfactant other than the anionic surfactants described above, suitable for application to the hair or skin. Such optional other surfactants should be chemically and physically compatible with the essential components of the shampoo composition, and should not otherwise unduly impair product performance, aesthetics or stability. Suitable other surfactants include, but are not limited to: amphoteric, zwitterionic, cationic, nonionic and mixtures thereof.

Amphoteric deterative surfactants suitable for use herein include, but are not limited to, those surfactants broadly described as derivatives of aliphatic secondary and tertiary amines in which the aliphatic radical can be straight or branched chain and wherein one of the aliphatic substituents contains from about 8 to about 18 carbon atoms and one contains an anionic water solubilizing group such as carboxy, sulfonate, sulfate, phosphate, or phosphonate.

Zwitterionic deterative surfactants suitable for use herein include, but are not limited to, those surfactants broadly described as derivatives of aliphatic quaternary ammonium, phosphonium, and sulfonium compounds, in which the aliphatic radicals can be straight or branched chain, and wherein one of the aliphatic substituents contains from about 8 to about 18 carbon atoms and one contains an anionic group such as carboxy, sulfonate, sulfate, phosphate or phosphonate. Preferred zwitterionic deterative surfactants are the betaines.

Cationic deterative surfactants suitable for use herein include, but are not limited to, surfactants containing quaternary nitrogen moieties. Examples of suitable cationic surfactants are those corresponding to the general Formula (XVIII):

wherein R_1 , R_2 , R_3 , and R_4 are independently selected from a C_1 to C_{22} aliphatic group or an aromatic, alkoxy, polyoxyalkylene, alkylamido, hydroxyalkyl, aryl or alkylaryl group having up to about 22 carbon atoms, preferably C_1 to C_{22} alkyl; and X is a salt-forming anion, such as those selected from halogen (e.g. chloride, bromide), acetate, citrate, lactate, glycolate, phosphate nitrate, sulfate, and alkylsulfate radicals. The aliphatic groups can contain, in addition to carbon and hydrogen atoms, ether

linkages, and other groups, such as amino groups. The longer chain (e.g. C₁₂ and higher) aliphatic groups can be saturated or unsaturated.

Preferred cationic deterative surfactants are those containing two long alkyl chains and two short alkyl chains or those containing one long alkyl chain and three short alkyl chains. Such long alkyl chains are preferably from C₁₂ to C₂₂, more preferably from C₁₆ to C₂₂. Such short alkyl chains are preferably from C₁ to C₃, more preferably from C₁ to C₂.

Nonionic deterative surfactants suitable for use herein include, but are not limited to, those compounds produced by condensation of alkylene oxide groups (hydrophilic in nature) with an organic hydrophobic compound, which may be aliphatic or alkyl aromatic in nature.

Non-limiting examples of other amphoteric, zwitterionic, cationic and nonionic deterative surfactants suitable for use in the anti-dandruff and conditioning shampoo composition of the present invention are described in McCutcheon's, *Emulsifiers and Detergents*, (1989), published by M. C. Pub. Co., and in U.S. Pat. No. 2,438,091; U.S. Pat. No. 2,528,378; U.S. Pat. No. 2,658,072; U.S. Pat. No. 3,155,591; U.S. Pat. No. 3,929,678; U.S. Pat. No. 3,959,461; U.S. Pat. No. 4,387,090; U.S. Pat. No. 5,104,646; U.S. Pat. No. 5,106,609; and U.S. Pat. No. 5,837,661, all of which descriptions are incorporated herein by reference.

B. Suspending agent

The anti-dandruff and conditioning shampoo compositions of the present invention may, in some embodiments, comprise from about 0.1% to about 10%, by weight of the composition, preferably from about 0.3% to about 5%, more preferably from about 0.3% to about 2.5%, of a suspending agent suitable for application to the hair or skin. It is believed that the suspending agent suspends water-insoluble, dispersed materials in the shampoo compositions. Such suspending agent should be physically and chemically compatible with the essential components of the composition, and should not otherwise unduly impair product stability, aesthetics or performance. Examples of suspending agents which may be suitably employed in the shampoo compositions herein include, but are not limited to: acyl derivatives, long chain amine oxides, xanthan gum, and mixtures thereof. These and other suitable suspending agents are described in further detail below.

1. Acyl derivatives and long chain amine oxides

Acyl derivative suspending agents include, but are not limited to: glyceryl esters, long chain hydrocarbyls, long chain esters of long chain fatty acids, long chain esters of long chain alkanol amides. Another suitable suspending agent group includes the long chain amine oxides. Acyl derivative and long chain amine oxide suspending agents are described in U.S. Pat. No. 4,741,855, which description is incorporated herein by reference.

Preferred acyl derivative suspending agents for use herein are glyceryl esters, which include C_{10} to C_{22} ethylene glycol esters of fatty acids. More preferred are the ethylene glycol stearates, both mono- and di-stearate, most preferred is ethylene glycol di-stearate containing less than about 7% of the mono-stearate.

Also suitable for use in the shampoo compositions herein are long chain (i.e. C_8 to C_{22}) hydrocarbyls, which include N,N-dihydrocarbyl amido benzoic acid and soluble salts thereof (e.g., Na, K), particularly N,N-di-(hydrogenated) C_{16} , C_{18} and tallow amido benzoic acid species of this family, available from Stepan Company. Non-limiting examples of long chain esters of long chain fatty acids include: stearyl stearate and cetyl palmitate. Non-limiting examples of long chain esters of long chain alkanol amides include: stearamide diethanolamide distearate and stearamide monoethanolamide stearate. Non-limiting examples of suitable long chain amine oxides for use as suspending agents herein include the alkyl (C_{16} - C_{22}) dimethyl amine oxides (e.g. stearyl dimethyl amine oxide).

2. Xanthan gum

Also suitable as a suspending agent herein is xanthan gum. The concentration of xanthan gum will typically range from about 0.1% to about 3%, by weight of the composition, preferably from about 0.4% to about 1.2%. The use of xanthan gum as a suspending agent in silicone containing shampoo compositions is described, for example, in U.S. Pat. No. 4,788,006, which description is incorporated herein by reference. Combinations of long chain acyl derivatives and xanthan gum may also be used as a suspending agent in the shampoo compositions, as is described in U.S. Pat. No. 4,704,272, which description is incorporated herein by reference.

3. Other suspending agents

Still other suitable suspending agents for use in the anti-dandruff and conditioning shampoo compositions of the present invention include carboxyvinyl polymers. Preferred among these polymers are the copolymers of acrylic acid crosslinked with polyallylsucrose, as described in U.S. Pat. No. 2,798,053, which description is incorporated herein by reference. Examples of these polymers include Carbopol 934, 940, 941, and 956, available from B. F. Goodrich Company.

Other suitable suspending agents for use herein include primary amines having a fatty alkyl moiety having at least about 16 carbon atoms (e.g. palmitamine, and stearamine), and secondary amines having two fatty alkyl moieties each having at least about 12 carbon atoms (e.g. dipalmitoylamine, and di-(hydrogenated tallow)-amine). Also suitable are di-(hydrogenated tallow)-phthalic acid amide, and cross-linked maleic anhydride-methyl vinyl ether copolymer.

Still other suitable suspending agents may be used in the shampoo compositions, including those that can impart a gel-like viscosity to the composition, such as water soluble or colloiddally water soluble polymers like cellulose ethers (e.g., methylcellulose, hydroxybutyl methylcellulose, hydroxypropylcellulose, hydroxypropyl methylcellulose, hydroxyethyl ethylcellulose and

hydroxyethylcellulose), guar gum, polyvinyl alcohol, polyvinyl pyrrolidone, hydroxypropyl guar gum, starch and starch derivatives, and other thickeners, viscosity modifiers, gelling agents, and mixtures thereof. A preferred viscosity modifier useful as a suspending agent is trihydroxystearin, (e.g. Thixin RTM, available from Rheox Company).

C. Polyalkylene glycol

The anti-dandruff and conditioning shampoo compositions of the present invention may, in some embodiments, further comprise from about 0.005% to about 1.5%, by weight of the composition, preferably from about 0.05% to about 1%, more preferably from about 0.1% to about 0.5%, most preferably from about 0.1% to about 0.3%, of selected polyalkylene glycols suitable for application to the hair or skin. The select polyalkylene glycols are believed to provide enhanced lather performance, improved shampoo spreadability, and importantly, when a particulate anti-dandruff agent is employed, increased anti-dandruff efficacy, to the compositions described herein. Such polyalkylene glycols should be physically and chemically compatible with the essential components described herein, and should not otherwise unduly impair product stability, aesthetics, or performance.

It has been found that these polyalkylene glycols, when added to the shampoo compositions described herein, enhance lather performance by delivering a richer, denser lather which correlates with consumer perception of hair conditioning performance. It has also been found that, in those embodiments which contain silicone conditioning agents, the selected polyalkylene glycols can reduce the concentration of anionic deterative surfactant necessary to provide hair cleaning. In such reduced-surfactant compositions, hair cleansing and conditioning performance remains good, while overall lather performance is enhanced. Polyethylene glycols, for example, are known for use in improving lather performance in cleansing compositions, as described in U.S. Pat. No. 5,837,661, which description is incorporated herein by reference.

It has also been found that these selected polyalkylene glycols, when added to a silicone-containing shampoo composition, enhance spreadability of the shampoo compositions in hair. Enhanced spreading of the shampoo composition during application also provides consumers with a perception of enhanced conditioning performance. This performance is especially surprising from these selected polyalkylene glycols which are known thickening agents, and as thickening agents would be expected to impair rather than enhance spreadability of the shampoo compositions into hair.

The polyalkylene glycols suitable for use in the shampoo compositions herein are characterized by the general Formula (XVII):

wherein **R** is hydrogen, methyl, or mixtures thereof, preferably hydrogen, and **n** is an integer having an average value from about 1,500 to about 120,000, preferably from about 1,500 to about 50,000, more preferably from about 2,500 to about 25,000, and most preferably from about 3,500 to about 15,000. When **R** is hydrogen, these materials are polymers of ethylene oxide, which are also known as polyethylene glycols. When **R** is methyl, these materials are polymers of propylene oxide, which are also known as polypropylene glycols. When **R** is methyl, it is also understood that various positional isomers of the resulting polymers can exist. Preferred for use herein are polyethylene glycols, polypropylene glycols, and mixtures thereof.

Specific non-limiting examples of polyethylene glycol polymers for use in the anti-dandruff and conditioning shampoo compositions of the present invention include: PEG 2M, wherein **R** is hydrogen and **n** has an average value of about 2,000 (e.g. Polyox WSR® N-10, available from Union Carbide); PEG 5M, wherein **R** is hydrogen and **n** has an average value of about 5,000 (e.g. Polyox WSR® N-35 and Polyox WSR® N-80, both available from Union Carbide); PEG 7M, wherein **R** is hydrogen and **n** has an average value of about 7,000 (e.g. Polyox WSR® N-750, available from Union Carbide); PEG 9M, wherein **R** is hydrogen and **n** has an average value of about 9,000 (e.g. Polyox WSR® N-3333, available from Union Carbide); PEG 14 M, wherein **R** is hydrogen and **n** has an average value of about 14,000 (e.g. Polyox WSR® N-3000, available from Union Carbide); PEG 23M, wherein **R** is hydrogen and **n** has an average value of about 23,000 (e.g. Polyox WSR® N-12k, available from Union Carbide); PEG 90M, wherein **R** is hydrogen and **n** has an average value of about 90,000 (e.g. Polyox WSR® 301, available from Union Carbide); and PEG 100M, wherein **R** is hydrogen and **n** has an average value of about 100,000 (e.g. Carbowax PEG 4600™, available from Union Carbide). Preferred polyethylene glycols include PEG 7M, PEG 14M, PEG 25M, PEG 90M, and mixtures thereof.

D. Hair Growth Regulating Agents

The compositions herein may also optionally comprise, in addition to zinc pyrithione, other hair growth regulating agents. Such agents can be chosen from a wide variety of molecules which can function in different ways to enhance the hair growth effects of a compound of the present invention. These optional agents, when present, are typically employed in the compositions herein at a level ranging from about 0.001% to about 15%, preferably from about 0.1% to about 10%, most preferably from about 0.5% to about 5% by weight of the composition.

As used herein, the term "hair growth regulating" is meant to include: stimulating hair growth and/or hair thickening; preventing, reducing, arresting and/or retarding the loss of hair and/or the

5
10 thinning of hair; increasing the rate of hair growth; inducing the formation of a greater number of hair strands; increasing the diameter of the hair strand; lengthening the hair strand; changing the hair follicle from vellus to terminal; converting follicles from telogen to anagen phase (thereby increasing the overall ratio of anagen phase follicles relative to telogen phase follicles); treating alopecias; and any combination thereof.

15 Vasodilators such as potassium channel agonists including, for example, minoxidil and minoxidil derivatives such as aminexil and such as those described in U.S. Patent 3,382,247, U.S. Patent 5,756,092, issued May 26, 1998, U.S. Patent 5,772,990, issued June 30, 1998, U.S. Patent 5,760,043, issued June 2, 1998, U.S. Patent 328,914, issued July 12, 1994, U.S. Patent 5,466,694, issued November 14, 1995, 5,438,058, issued August 1, 1995, and U.S. Patent 4,973,474, issued November 27, 1990, (all of which are herein incorporated by reference), and cromakalin and diazoxide can be used as optional hair growth regulating agents in the compositions herein.

25 One suitable class of optional activity enhancer for use herein are anti-androgens. Examples of suitable anti-androgens may include, but are not limited 5- α -reductase inhibitors such as finasteride and those described in U.S. Patent 5,516,779, issued May 14, 1996 (herein incorporated by reference) and in Nnane et al, Cancer Research 58, "Effects of Some Novel Inhibitors of C17,20-Lyase and 5 α -Reductase *in Vitro* and *in Vivo* and Their Potential Role in the Treatment of Prostate Cancer., as well as cyproterone acetate, azelaic acid and its derivatives and those compounds described in U.S. Patent 5,480,913, issued January 2, 1996, flutamide, and those described in U.S. Patents 5,411,981, issued May 2, 1995, U.S. Patent 5,565,467, issued October 15, 1996 and U.S. Patent 4,910,226, issued March 20, 1990, all of which are herein incorporated by reference.

35 Another suitable class of optional hair growth regulating agents are immunosuppressants such as 1) cyclosporin and cyclosporin analogs including those described in U.S. Provisional Patent Application No. 60/122,925, Fulmer et al., "Method of Treating Hair Loss Using Non-Immunosuppressive Compounds", filed March 5, 1999, herein incorporated by reference, and 2) FK506 analogs such as those described in U.S. Provisional Patent Application No. 60/102,449, McIver et al., "Heterocyclic 2-Substituted Ketoamides", filed September 30, 1998, U.S. Provisional Patent Application No. 60/102,448, McIver et al., "2-Substituted Ketoamides", filed September 30, 1998, U.S. Provisional Patent Application No. 60/102,539, McIver et al., "2-Substituted Heterocyclic Sulfonamides", filed September 30, 1998, U.S. Provisional Patent Application No. 60/102,458, Tiesman et al., "Method of Treating Hair Loss Using Ketoamides", filed September 30, 1998, and U.S. Provisional Patent Application No. 60/102,437, McIver et al., "Method of Treating Hair Loss Using Sulfonamides", filed September 30, 1998, all of which are herein incorporated by reference.

5

Another suitable class of optional hair growth regulating agents are anti-microbials such as selenium sulfide, ketoconazole, triclocarbon, triclosan, zinc pyrithione, itraconazole, asiatic acid, hinokitiol, mipirocin and those described in EPA 0,680,745 (herein incorporated by reference), clinacycin hydrochloride, benzoyl peroxide, benzyl peroxide and minocyclin.

10

Anti-inflammatories can also be incorporated into the compositions herein as an optional activity enhancer. Examples of suitable anti-inflammatories may include glucocorticoids such as hydrocortisone, mometasone furoate and prednisolone, nonsteroidal anti-inflammatories including cyclooxygenase or lipoxygenase inhibitors such as those described in U.S. Patent 5,756,092, and benzydamine, salicylic acid, and those compounds described in EPA 0,770,399, published May 2, 1997, WO 94/06434, published March 31, 1994 and FR 2,268,523, published November 21, 1975, all of which are herein incorporated by reference.

15

20

Another suitable class of optional hair growth regulating agents are thyroid hormones and derivatives and analogs thereof. Examples of suitable thyroid hormones for use herein may include triiodothyronine. Examples of thyroid hormone analogs which may be suitable for use herein include those described in U.S. Provisional Patent Application No. 60/136,996, Zhang et al., "Method of Treating Hair Loss", filed June 1, 1999, U.S. Provisional Patent Application No. 60/137,024, Zhang et al., "Method of Treating Hair Loss Using Biphenyl Compounds", filed June 1, 1999, U.S. Provisional Patent Application No. 60/137,022, Zhang et al., "Method of Treating Hair Loss Using Carboxyl Derivatives", filed June 1, 1999, U.S. Provisional Patent Application No. 60/137,023, Zhang et al., "Method of Treating Hair Loss Using Sulfonyl Thyromimetic Compounds", filed June 1, 1999, U.S. Provisional Patent Application No. 60/137,052, Youngquist et al., "Biaryl Compounds", filed June 1, 1999, U.S. Provisional Patent Application No. 60/137,063, Youngquist et al., "Sulfur-Bridged Compounds", filed June 1, 1999, and U.S. Provisional Patent Application No. 60/136,958, Youngquist et al., "Substituted Biaryl Ether Compounds", filed June 1, 1999.

25

30

35

40

Prostaglandin agonists or antagonists can also be used as optional hair growth regulating agents in the compositions herein. Examples of suitable prostaglandins agonists or antagonists include latanoprost and those described in WO 98/33497, Johnstone, published August 6, 1998, WO 95/11003, Stjernschantz, published April 27, 1995, JP 97-100091, and Ueno, JP 96-134242, Nakamura.

45

50

Another class of optional hair growth regulating agents for use herein are retinoids. Suitable retinoids may include isotretinoin, acitretin, tazarotene,

Non-limiting examples of penetration enhancers which may be used as optional hair growth regulating agents herein include, for example, 2-methyl propan-2-ol, propan-2-ol, ethyl-2-hydroxypropanoate, hexan-2,5-diol, POE(2) ethyl ether, di(2-hydroxypropyl) ether, pentan-2,4-diol,

55

005240" 042500

acetone, POE(2) methyl ether, 2-hydroxypropionic acid, 2-hydroxyoctanoic acid, propan-1-ol, 1,4-dioxane, tetrahydrofuran, butan-1,4-diol, propylene glycol dipelargonate, polyoxypropylene 15 stearyl ether, octyl alcohol, POE ester of oleyl alcohol, oleyl alcohol, lauryl alcohol, dioctyl adipate, dicapryl adipate, di-isopropyl adipate, di-isopropyl sebacate, dibutyl sebacate, diethyl sebacate, dimethyl sebacate, dioctyl sebacate, dibutyl suberate, dioctyl azelate, dibenzyl sebacate, dibutyl phthalate, dibutyl azelate, ethyl myristate, dimethyl azelate, butyl myristate, dibutyl succinate, didecyl phthalate, decyl oleate, ethyl caproate, ethyl salicylate, *iso*-propyl palmitate, ethyl laurate, 2-ethyl-hexyl pelargonate, *iso*-propyl isostearate, butyl laurate, benzyl benzoate, butyl benzoate, hexyl laurate, ethyl caprate, ethyl caprylate, butyl stearate, benzyl salicylate, 2-hydroxypropanoic acid, 2-hydroxyoctanoic acid, methylsulfoxide, N,N-dimethyl acetamide, N,N-dimethyl formamide, 2-pyrrolidone, 1-methyl-2-pyrrolidone, 5-methyl-2-pyrrolidone, 1,5-dimethyl-2-pyrrolidone, 1-ethyl-2-pyrrolidone, phosphine oxides, sugar esters, tetrahydrofurfural alcohol, urea, diethyl-*m*-toluamide, 1-dodecylazacycloheptan-2-one and those described in U.S. Patent 5,015,470, issued May 14, 1991 and U.S. Patent 5,496,827, issued July 15, 1994 (both of which are herein incorporated in its entirety by reference).

Other classes of optional hair growth regulating agents for use herein include flavinoids, ascomycin derivatives and analogs, histamine antagonists such as diphenhydramine hydrochloride, other triterpenes such as oleanolic acid and ursolic acid and those described in U.S. Patent 5,529,769, JP 10017431, WO 95/35103, U.S. Patent 5,468,888, JP 09067253, WO 92/09262, JP 62093215, U.S. Patent 5,631,282, U.S. Patent 5,679,705, JP 08193094, saponins such as those described in EP 0,558,509 to Bonte et al, published September 8, 1993 and WO 97/01346 to Bonte et al, published January 16, 1997 (both of which are herein incorporated by reference in their entirety), proeoglycanase or glycosaminoglycanase inhibitors such as those described in U.S. Patents 5,015,470, issued May 14, 1991, U.S. Patent 5,300,284, issued April 5, 1994 and U.S. Patent 5,185,325, issued February 9, 1993 (all of which are herein incorporated in their entirety by reference) estrogen agonists and antagonists, pseudoterins, cytokine and growth factor promoters, analogs or inhibitors such as interleukin1 inhibitors, interleukin-6 inhibitors, interleukin-10 promoters, and tumor necrosis factor inhibitors, vitamins such as vitamin D analogs and parathyroid hormone antagonists, Vitamin B12 analogs and panthenol, interferon agonists and antagonists, hydroxyacids such as those described in U.S. Patent 5,550,158, benzophenones and hydantoin anticonvulsants such as phenytoin.

Other hair growth agents are described in detail in, for example, JP 09-157,139 to Tsuji et al, published June 17, 1997; EP 0277455 A1 to Mirabeau, published August 10, 1988; WO 97/05887 to Cabo Soler et al, published February 20, 1997; WO 92/16186 to Bonte et al, published March 13, 1992; JP 62-93215 to Okazaki et al, published April 28, 1987; U.S. Patent 4,987,150 to Kurono et al, issued January 22, 1991; JP 290811 to Ohba et al, published October 15, 1992; JP 05-286,835 to

5 Tanaka et al, published November 2, 1993, FR 2,723,313 to Greff, published August 2, 1994, U. S.
Patent 5,015,470 to Gibson, issued May 14, 1991, U.S. Patent 5,559,092, issued September 24, 1996,
10 U.S. patent 5,536,751, issued July 16, 1996, U.S. Patent 5,714,515, issued February 3, 1998, EPA
0,319,991, published June 14, 1989, EPA 0,357,630, published October 6, 1988, EPA 0,573,253,
published December 8, 1993, JP 61-260010, published November 18, 1986, U.S. Patent 5,772,990,
15 issued June 30, 1998, U.S. Patent 5,053, 410, issued October 1, 1991, and U.S. Patent 4,761,401,
issued August 2, 1988, all of which are herein incorporated by reference.

Some preferred hair growth regulating agents for use herein are zinc salts of carboxylic acids,
20 saponins, triterpenes, oleanolic acid, ursolic acid, betulinic acid, betulonic acid, crataegolic acid,
celastrol, asiatic acid, inhibitors of 5- α -reductase, progesterone, 1,4-methyl-4-azasteroids, 17- β -N,N-
diethylcarbamoyl-4-methyl-4-aza-5- α -androstan-3-one, androgen receptor antagonists, cyproterone
acetate, minoxidil, azelaic acid and derivatives thereof, cyclosporin, triiodothyronine, diazoxide,
25 potassium channel openers, cromakalin, phenytoin, ketoconazole, finasteride, dutasteride, coal tar, zinc
gluconate, glucocorticoids, macrolides, aminexil, and mixtures thereof.

30 E. Other Optional Ingredients

The anti-dandruff and conditioning shampoo compositions of the present invention may, in
some embodiments, further comprise additional optional components known or otherwise effective for
35 use in hair care or personal care products. The concentration of such optional ingredients generally
ranges from zero to about 25%, more typically from about 0.05% to about 25%, even more typically
from about 0.1% to about 15%, by weight of the composition. Such optional components should also
be physically and chemically compatible with the essential components described herein, and should
40 not otherwise unduly impair product stability, aesthetics or performance.

Non-limiting examples of optional components for use in the shampoo composition include
anti-static agents, foam boosters, anti-dandruff agents in addition to the anti-dandruff agents described
45 above, viscosity adjusting agents and thickeners, pH adjusting agents (e.g. sodium citrate, citric acid,
succinic acid, phosphoric acid, sodium hydroxide, and sodium carbonate), preservatives (e.g. DMDM
hydantoin), anti-microbial agents (e.g. triclosan or triclocarbon), dyes, organic solvents or diluents,
50 pearlescent aids, perfumes, fatty alcohols, proteins, skin active agents, sunscreens, vitamins, and
pediculocides.

Optional anti-static agents such as water-insoluble cationic surfactants may be used, typically
in concentrations ranging from about 0.1% to about 5%, by weight of the composition. Such anti-static
55 agents should not unduly interfere with the in-use performance and end-benefits of the shampoo

composition; particularly, the anti-static agent should not interfere with the anionic surfactant. A specific non-limiting example of a suitable anti-static agents is tricetyl methyl ammonium chloride.

Optional foam boosters for use in the shampoo compositions described herein include fatty ester (e.g. C_8-C_{22}) mono- and di (C_1-C_8 , especially C_1-C_3) alkanol amides. Specific non-limiting examples of such foam boosters include coconut monoethanolamide, coconut diethanolamide, and mixtures thereof.

Optional viscosity modifiers and thickeners may used, typically in amounts effective for the anti-dandruff and conditioning shampoo compositions of the present invention to generally have an overall viscosity from about 1,000 csk to about 20,000 csk, preferably from about 3,000 csk to about 10,000 csk. Specific non-limiting examples of such viscosity modifiers and thickeners include: sodium chloride, sodium sulfate, and mixtures thereof.

III. Methods of Manufacture

The anti-dandruff and conditioning shampoo compositions of the present invention may be prepared by any known or otherwise effective technique, suitable for providing a shampoo composition provided that the resulting composition provides the excellent hair feel benefits described herein. Methods for preparing the anti-dandruff and conditioning shampoos of the present invention include conventional formulation and mixing techniques. A method such as that described in U.S. Pat. No. 5,837,661, which description is incorporated herein by reference, could be employed, wherein the anti-dandruff agent of the present invention would typically be added in the same step as the silicone premix is added in the '661 description.

IV. Methods of Use

The anti-dandruff and conditioning shampoo compositions of the present invention are used in a conventional manner for cleansing and conditioning the hair or skin. They are particularly used in a conventional manner for treating the condition commonly known as dandruff. An effective amount of the composition for cleansing and conditioning the hair or skin is applied to hair, or other region of the body, that has preferably been wetted, generally with water, and then the composition is rinsed off. Effective amounts typically range from about 1g to about 50g, preferably from about 1g to about 20g. Application to the hair typically includes working the composition through the hair such that most or all of the hair is contacted with the composition.

This method for providing anti-dandruff efficacy and conditioning hair comprises the steps of: (a) wetting the hair with water, (b) applying an effective amount of the shampoo composition to the hair, and (c) rinsing the shampoo composition from the hair using water. These steps may be repeated as many times as desired to achieve the cleansing, conditioning, and anti-dandruff benefits sought.

It is also contemplated that when the anti-dandruff particulate employed is zinc pyrithione, and/or if other optional hair growth regulating agents are employed, the shampoo compositions of the present invention, may, provide for the regulation of growth of the hair. The method of regularly using such shampoo compositions comprises steps a, b, and c (above).

ANALYTICAL METHODS

The anti-dandruff and conditioning shampoo compositions of the present invention, when applied to the hair in a manner consistent with the methods of use described below, provide a superior combination of anti-dandruff efficacy and conditioning. The shampoo compositions, when applied to the hair exhibit certain physical characteristics which are measured by the bioavailability/coverage index, the first conditioning index (wet detangling), the second conditioning index (clean hair feel), and the minimum inhibitory concentration index. The methods to be employed for determining the values of these indices are described in detail below.

A. Method for assessing bioavailability/coverage index

The bioavailability/coverage index of a shampoo composition is indicative of anti-dandruff efficacy provided by the shampoo. Generally, the higher the index value of the composition, the better its anti-dandruff efficacy, due to increased bioavailability of the anti-dandruff agent, increased coverage of the anti-dandruff agent, or both.

1. Principle

Samples of product, control, and placebo are applied to portions of pigskin, which are then lathered and rinsed. Agar contact plates inoculated with *Malassezia furfur* are exposed to the pigskin surface, and after an incubation period, the plates are analyzed using commercially available software to determine the area of the agar surface which has been colonized by *M. furfur*. An index is calculated comparing the area colonized in a control relative to the area colonized in each sample. The inhibition of *M. furfur* growth on the plates is indicative of the bioavailability of the anti-dandruff agent and coverage of the anti-dandruff agent, which together and independently are indicative of overall anti-dandruff efficacy.

5

2. Equipment

Pigskin	sterilized via irradiation; shaved, full thickness, size = dependent on the number of test products (typically at least about 2100 cm ²)
Product	1.5 ml per product to be tested
Control	1.5 ml per control to be tested
Placebo	1.5 ml per placebo to be tested
Beaker	3000 ml
Petri dish	1 per sample to be tested; size = 15 mm x 150 mm; sterilized
Agar contact plates	4 per sample to be tested; size = 35mm x 10 mm
Microbe	10 µl of <i>M. furfur</i> (ATCC 14521) broth culture per sample to be tested
Volumetric pipette	variable 10µl - 100µl
Data system	ImagePro Plus® imaging software, available from Fryer Company (Huntley, Illinois), or equivalent
Statistical software	Microsoft Excel®, available from Microsoft Corporation, or equivalent; run two-tailed, homoscedastic, T-test.

3. Reagents

A. Broth formulation (adjusted to pH 5.6 with 5 N HCl)

<u>Component</u>	<u>quantity</u>
Oxygall ¹	15.0 g/l
Polypeptone ²	5.0 g/l
Gelysate Peptone ³	5.0 g/l
Palmitic Acid	1.0 ml/l
Myristic Acid	1.0 ml/l
Sodium Lactate	10.0 ml/l
(agar)	15.0 g/l

1. Dehydrated fresh bile, available from Difco Company.
2. Pancreatic digest of casein and peptic digest of animal tissue, available from BBL Company.
3. Pancreatic digest of gelatin, available from BBL Company.

55

B. Control and Placebo formulations (%. by weight. of the composition)

10	<u>Component</u>	<u>Control</u>	<u>Placebo</u>
	Ammonium Laureth-3 Sulfate	15.00	15.00
	Ammonium Lauryl Sulfate	5.00	5.00
15	Sodium Lauroyl Sarcosinate ¹	1.50	1.50
	Ethylene Glycol Distearate	1.50	1.50
	Polyquaternium 10 ²	0.025	0.025
	Polyethylene Glycol ³	0.125	0.125
20	Zinc pyridinethione ⁴	1.00	---
	Sodium Sulfate	0.875	0.875
	DMDM Hydantoin	0.2035	0.2035
25	Lauryl Alcohol	0.15	0.15
	Perfume	0.65	0.65
	Water ⁵	----- quantity sufficient -----	
30	1. Hamposyl L-30. as a 30% active solution. available from Hampshire Chemical Company.		
	2. UCARE Polymer JR 30M. available from Amerchol.		
	3. Carbowax 600 (known as PEG 12). available from Sentry Company.		
	4. ZPT having an average particle size of about 2.5µm. available from Arch/Olin.		
35	5. After Control and Placebo are prepared, adjust pH of Control and Placebo to within the range from about pH 5 to about pH 7, using conventional pH modifiers.		

4. Experimental procedure

A. Preparation of the contact plates

- 1) Add 7.5 ml molten agar to the lid of a petri plate and allow agar to solidify.
- 2) Store the plate from about 12 hours to about 24 hours at 30°C.

B. Preparation of pigskin

- 1) Store pigskin at 0°C until needed.
- 2) Thaw pigskin at room temperature for 3 hours and blot dry with paper towels.
- 3) Cut pigskin into 10 cm x 10 cm pieces; 3 pieces for each product, control, and placebo to be tested.
- 4) Place pigskin pieces into separate petri dishes until ready for washing.

5

C. Test setup

- 1) Wash each pigskin piece by applying 0.5 ml of sample to the pigskin surface and lathering for 1 minute over the entire surface.
- 2) Gently rinse the pigskin surface by submerging it in a beaker of water for 5 seconds.
- 3) Perform steps 1 and 2 on two additional pigskin pieces for a total of 3 per sample to be tested.
- 4) Allow the skin surface to air dry in a sterile petri dish (with the lid cracked) for about 2 hours.
- 5) Inoculate the contact plates with 10 μ l *M. furfur* (suspended in broth at a concentration of 1.3×10^5 cfu/ml).
- 6) Press each agar contact plate (4 per pigskin piece; total of 12 per product, control, and placebo to be tested) firmly against the treated pigskin surface for 15 minutes. Remove the contact plates and incubate them for about 72 hours to about 168 hours at 30°C.
 - i) At periodic times during the incubation, analyze the control contact plates and the placebo contact plates using the imaging software to determine the area of the contact plates surface which has been colonized by *M. furfur*.
 - ii) Compare the average area colonized of the control contact plates versus the average area colonized of the placebo contact plates, and calculate a ratio by dividing the average area colonized of the control contact plates by the average area colonized of the placebo contact plates.
 - iii) When the ratio is between about 0.40 to about 0.60, end the incubation.

D. Analyzing anti-microbial activity

- 1) After the incubation, analyze the product contact plates using the imaging software to determine the average area of the product contact plates surface which has been colonized by *M. furfur*.
- 2) Apply a standard statistical T-test to determine whether tested products are significantly different at P value less than or equal to 0.10. The tested products must be significantly different at this level.

5. Determining index value

Compare the average area colonized of the control contact plates versus the average area colonized of the product contact plates, and calculate a ratio by dividing the average area colonized of the control contact plates by the average area colonized of the product contact plates. For example, if the average area colonized of the control contact plates is 400 mm², and the average area colonized of the product contact plates is 500 mm², then the index is 400 mm²/ 500 mm², which is equal to an index value of 0.80.

5

B. Method for assessing first conditioning index

10 The first conditioning index value relates to conditioning, as realized by consumers of the shampoo composition. Generally, the lower the index value of the composition, the better its conditioning, due to easier to comb and less tangled wet hair.

15

1. Principle

20 Samples of product are applied to ponytail hair switches, which are then lathered and rinsed. Conditioning is graded by the force required to pull a comb through the hair switch. Such force is measured using a force transducer or a load cell. Hair switches are attached to hang vertically from the force transducer. When a force, here combing, is applied to the force transducer, the force units are represented by a voltage that is proportional to the force applied. The voltage signal from the load cell is transferred to a computer via a commercially available analog-digital interface. The voltage signal is converted to a numeric value by commercially available computer software. Each time a force is applied to the force transducer, a force/time curve is generated. Within a single sample run of multiple applied forces, the value generated is the sum of the integration of these force/time curves. This value is called combing force. Because the apparatus is not calibrated to the computer, all tests with multiple samples are evaluated by relative comparison. The conditioning of a sample is then reported as an index versus a control.

2. Equipment

35

Hair switches Dark brown, European, blended virgin hair; weight = 4 grams
workable hair; length = 8 inches; available from International Hair
Importers and Products; 15 switches per product to be tested (6 for
40 products and 9 for controls)

40

Sink conventional lab sink with a horizontal bar in place about 20 inches
above it

45

Water temperature = 100° F, fed through a flexible hose

Combs 1 per hair switch tested; plastic barber's comb, about 9 teeth/inch

Timer Able to measure seconds

Product 3cc product/switch

50

Computer Capable of running Dash-8® software, or equivalent

Force Transducer 1000g load cell, Model #FTD-G-1000, available from Schaevitz
Company, or equivalent

55

Analog/Digital Interface Dash-8®, available from Metrabyte Company, or equivalent

Software Dash-8®, available from Metrabyte Company, or equivalent

005246 042500

3. Reagents

A. Control composition

Raw Material	(weight %)
Ammonium Laureth-3 Sulfate	15.00
Ammonium Lauryl Sulfate	5.00
Sodium Lauroyl Sarcosinate ¹	1.50
Ethylene Glycol Distearate	1.50
Polyquat 10 ²	0.025
Zinc Pyridinethione ³	1.00
Polyethylene Glycol ⁴	0.125
Sodium Sulfate	0.875
DMDM Hydantoin	0.2035
Lauryl Alcohol	0.15
Water ⁵	QS

1. Hamposyl L-30, as a 30% active solution, available from Hampshire Chemical Company.
2. UCARE Polymer JR 30M, available from Amerchol.
3. ZPT having an average particle size of about 2.5 μ m, available from Arch/Olin.
4. Carbowax 600 (known as PEG 12), available from Sentry Company.
5. Adjust to pH from about pH 5 to about pH 7, using conventional pH modifiers.

B. Initial Hair Ranking composition

Raw Material	weight %
Ammonium Laureth-3 Sulfate	51.24
Ammonium Lauryl Sulfate	36.38
Cocamide DEA	2.30
Ammonium Xylenesulfonate	3.50
Perfume	0.50
Water	quantity sufficient

4. Experimental procedure

A. Initial Hair Ranking the hair switches

- 1) All hair switches must be cleaned and ranked prior to conducting each test to determine the first conditioning index in order to adjust for uncontrollable performance variables between

each untreated hair switch within a given set. This ranking procedure groups specific hair switches into sub-sets or groups, so that the performance of all groups together will be uniform.

- 2) Assemble all the hair switches to be used in the testing.
- 3) Treat the hair switches according to the protocol detailed in Part B below, using the Initial Hair Ranking composition in lieu of test products, however, still use the control composition where designated.
- 4) Select hair switches that have combing forces within some range of the mean combing force (typically 2 standard deviations from the mean).
- 5) Arrange the hair switches into groups such that the baseline combing force is spread uniformly across all of the treatment groups. For example, if 12 switches are to be used in 3 testing groups, then rank them according: the hair switch with the highest combing force is put in Group 1, the hair switch with the second highest into Group 2, the hair switch with the third highest into Group 3, the hair switch with the fourth highest into Group 1, etc.

B. Treating the hair switches

- 1) Hang a hair switch above a sink from a horizontal bar, and thoroughly wet it using water at 100° F and a flow rate of 1.5 gallons/minute.
- 2) Squeeze out excess water with the hand.
- 3) Apply 0.4cc of test or control sample evenly down the hair switch, using at least 8 hair switches per product to be tested. Apply samples to the hair switches in a round-robin fashion, i.e. switch #1 of each set - sample #1, then switch #1 of each set, sample #2, etc. An example is to apply in the following order: 1A, 1B, 1C, 2A, 2B, 2C, 3A, 3B, 3C, etc., wherein letters refer to a product to be tested, and numbers refer to a replicate number.
- 4) Using the thumb and forefinger, milk sample into the hair switch for 30 seconds.
- 5) Rinse the hair switch with 100° F water for 30 seconds. Support back of hair switch with one hand, while allowing water to pulse down the entire hair switch.
- 6) Squeeze out excess water with the hand.
- 7) Apply 0.4cc of test or control sample evenly down the hair switch, again in round-robin fashion.
- 8) Work the product into the hair while tangling the hair switch, using a side-to-side motion, for 30 seconds.
- 9) Rinse with 100° F water for 60 seconds.
- 10) Squeeze out excess water with the hand.
- 11) After all treatments are completed, detangle the hair switch while still wet, using a comb, in the manner described below (Part C).

C. Detangling and Collecting Data

- 1) Use a force transducer, interfaced with a computer software program via an analog/digital interface to cumulate and integrate the force/time data.
- 2) Tightly secure the hair switch in the transducer clamp, such that the hair switch hangs vertically.
- 3) When the measuring apparatus is ready for a test run, begin combing the hair switch by feathering out the tangles, starting at the bottom of the hair switch. Be cautious not to grasp the hair with the other hand as this may be registered as detangling force or may block force from being registered. Work the comb gradually toward the top of the hair switch as tangles are removed.
- 4) When the hair switch can be combed without catching any tangles, do three more combing strokes and then stop combing.
- 5) Indicate to the software that the testing is complete for that sample.
- 6) Remove the hair switch from the transducer clamp.
- 7) Perform steps 1-6 (above) for each switch, conduct the combing in a round-robin order across the total set of switches.
- 8) Calculate average values and statistical difference using the Fisher's Least Significant Difference (LSD) procedure, with a P value of less than or equal to 1.0. The tested products must be significantly different at this level.

5. Determining index value

Compare the average combing force of each test product versus the average combing force of the control and calculate a ratio by dividing the combing force of a test product by the combing force of the control. For example, if the test product receives a combing force of 1500 force/time units and the control receives a combing force of 1300 force/time units, then the test product's index value is $1500/1300$, which is equal to an index value of 1.15.

C. Method for assessing second conditioning index

The second conditioning index is indicative of conditioning, as realized by consumers of the shampoo composition. Generally, the higher the index value of the composition, the better its conditioning, due to increased clean hair feel.

1. Principle

Samples of product and controls are applied to ponytail hair switches using brushes. Trained sensory panelists evaluate the "clean feel" attribute of each switch treated with product and each switch treated with control samples, using their thumb and forefinger. The trained sensory panelists then

assign a numerical value from 0 to 10, 10 being the greatest amount of clean feel. Within each clean feel test, two test samples are evaluated against two identified anchors and one blinded internal control. An index is calculated by comparing the clean feel attribute value of the test product relative to the clean feel attribute value of a control. How well a test sample scores for clean feel is indicative of its conditioning performance.

2. Equipment

Hair Switches	Caucasian, ponytail, weight = 20 gram; length = 8 inches, available from International Hair Importers and Products; 15 switches per product to be tested (6 for products, 9 for controls)
Trained Panelists	12 sensory panelists
Sink	conventional lab sink with a horizontal bar in place about 20 inches above it
Water	temperature = 100° F, fed through a flexible hose
Brushes	1 per hair switch tested; plastic molded bristle brush, available from Goody
Combs	1 per hair switch tested; plastic barber's comb, about 9 teeth/inch
Timer	Able to measure seconds
Product	30cc product per hair switch

1. Hamposyl L-30, as a 30% active solution, available from Hampshire Chemical Company.
2. A 40(gum) / 60 (fluid) weight based ratio blend of SE-76 dimethicone gum, available from General Electric Silicones, and a dimethicone fluid having a viscosity of 350 csk.
3. Silicone 300,000 csk, available from General Electric Silicones.
4. UCARE Polymer LR 400, available from Amerchol.
5. UCARE Polymer JR 30M, available from Amerchol.
6. Jaguar C 17, available from Rhodia.
7. Polyox WSR N-750, available from Union Carbide.
8. Carbowax 600, available from Sentry Company.
9. ZPT having an average particle size of about 2.5µm, available from Arch/Olin.
10. Puresyn 6, available from Mobil.
11. Mobil P43, available from Mobil.
12. Adjust to pH from about pH 5 to about pH 7, using conventional pH modifiers.

4. Experimental procedure

A. Preparation of the hair switches

- 1) All hair switches must be cleaned and ranked prior to conducting each test to determine the first conditioning index in order to adjust for uncontrollable performance variables between each untreated hair switch within a given set. This ranking procedure groups specific hair switches into sub-sets or groups, so that the performance of all groups together will be uniform.
- 2) Assemble all the hair switches to be used in the testing for test products and the Internal Control.
- 3) Treat the hair switches according to the protocol detailed in Part B below, using the High Anchor composition only.
- 4) Two to three trained panelists should feel the hair switches and select a set of 3 hair switches that feel similarly. (A panelist is considered to be trained if the person is able to pick out the high and low anchors in a blinded context as well as to place the internal control in the appropriate range.)
- 5) These similar hair switches will be used for the 2 test products and for the Internal Control. Hair switches for the High Anchor and Low Anchor are not ranked.

5

B. Treatment of the hair switches

- 1) Hang a switch above a sink, and thoroughly wet hair using water at 100° F and a flow rate of 1.5 gallons/minute.
- 2) Squeeze excess water with the hand.
- 3) Apply 5cc of test or control sample to one side of hair switch and work the product in so it stays on hair. Apply samples to the hair switches in a round-robin fashion, i.e. switch #1 of each set - sample #1, then switch #1 of each set, sample #2, etc. An example is to apply in the following order: 1A, 1B, 1C, 2A, 2B, 2C, 3A, 3B, 3C. etc., wherein letters refer to a product to be tested, and numbers refer to a replicate number.
- 4) Brush product through the hair switch for 30 seconds at a rate of about one stroke/second.
- 5) Rinse the hair switch for 30 seconds. Support the back of the hair switch with one hand, while allowing water to pulse down the entire hair switch.
- 6) Turn the hair switch over and apply 5cc of the same sample to other side of the hair switch and work the product in.
- 7) Brush product through the hair switch for 30 seconds at a rate of about one stroke/second.
- 8) Rinse the hair for 30 seconds at a rate of about one stroke/second. Support the back of the hair switch with one hand, while allowing water to pulse down the entire hair switch.
- 9) Perform steps 1-8 a second time.
- 10) Perform steps 1-8 a third time.

C. Evaluation of the hair switches

- 1) After steps 1 through 10 (above in Part B) have been completed the trained panelists will evaluate the hair switches.
- 2) Hang five treated switches at the sink, identifying a switch treated with the high anchor, and a switch treated with the low anchor. Identify a hair switch that was treated with the internal control, and hair switches treated with the two different test products, simply as "A," "B," and "C." The internal control label should vary from test to test to prevent bias.
- 3) The trained panelists should evaluate the hair switches using the following protocol:
- 4) The trained panelists should not to rewet hair, but may comb the hair (using a different comb for each switch) to realign the hair.
- 5) With a bare hand, the trained panelist's thumb is placed on the front of the hair switch while the index and middle fingers are on the back of hair switch. Using moderate pressure, the hair is pushed up with the thumb. This motion is continued down the length of the hair switch. It is important to use an up-and-down motion, as opposed to a side-to-side motion, as the feels are quite different.

- 5
- 6) Using the high and low anchors as guidelines, the trained panelists should assign a numerical value to each hair switch labeled A, B, and C, rating the clean hair feel of each. The low anchor should be assigned the value 0, and the high anchor should be assigned the value 10. (While unknown to the trained panelists, the internal control value typically is from about 2.5 to about 4.0.)
- 10
- 7) Each set of treated hair switches is evaluated by four panelists and then removed.
- 15
- 8) Record all of the values assigned to all of the hair switches by all of the trained panelists.
- 9) Calculate average values and statistical difference using the Fisher's Least Significant Difference (LSD) procedure, with a P value of less than or equal to 1.0. The tested products must be significantly different at this level.
- 20

5. Determining index value

25

Compare the average clean feel attribute value of the test product versus the average clean feel attribute value of the internal control, and calculate a ratio by dividing the clean feel attribute value of the test product by the clean feel attribute value of the internal control. For example, if the test product receives a clean feel attribute value of 2.0 and the internal control receives a clean feel attribute value of 3.5, then the test product's index is $2.0/3.5$, which is equal to an index value of 0.57.

30

D. Minimum inhibitory concentration

35

The Minimum Inhibitory Concentration index is indicative of anti-dandruff efficacy. Generally, the higher the index value of the composition, the better its anti-dandruff efficacy, due to increased inherent ability of the anti-dandruff agent to inhibit the growth of microorganisms.

1. Principle

40

Malassezia furfur is grown in a flask containing mDixon medium (see E. Gueho, et al. Antoinie Leeuwenhoek (1996), no. 69, 337-55, which description is incorporated by reference herein). Dilutions of solubilized anti-microbial active are then added to test tubes containing molten mDixon agar. *M. furfur* inoculum is added to each tube of molten agar, the tube vortexed, and the contents poured into separate sterile petri dishes. After the plates are incubated, they are observed for visible *M. furfur* growth. The lowest tested dilution of anti-microbial active that yields no growth is defined as the Minimal Inhibitory Concentration (MIC). An MIC index value is calculated comparing the MIC value for anti-microbial active to the MIC value for ZPT. The MIC index value is indicative of the potency of an anti-microbial active.

45

50

55

5

2. Equipment/Reagents

Microbe	<i>Malassezia furfur</i> (ATCC 14521)
Erlenmeyer flask	250ml
Agar medium	9.5ml mDixon agar per concentration per active to be tested
Solvent	water, dimethyl sulfonyl oxide ("DMSO"), others suitable for actives to be tested
Zinc pyridinethione	ZPT having an average particle size of about 2.5µm, preserved in Darvan™, available from Arch/Olin
Test tubes	2 tubes per anti-microbial active per concentration per active to be tested, sterilized, size = 18mm x 150mm
Petri dishes	2 dishes per anti-microbial active per concentration per active to be tested, sterilized, size = 15mm x 100mm

3. Experimental procedure

- 1) Grow *Malassezia furfur* in a 250 ml Erlenmeyer flask containing 100 ml mDixon medium at 320 rpm and 30°C until turbid.
- 2) Prepare selected dilutions, using a two-fold dilution series, of anti-microbial active in solvent, which allows the sample active to be solubilized prior to addition to the final test agar. For each concentration of the ZPT samples, the solvent must be DMSO; for other samples, the solvent may be water or DMSO or others suitable solvent.
- 3) Add 0.25 ml dilutions of anti-microbial active to test tubes containing 9.5 ml molten mDixon agar (held at 45°C in a water bath).
- 4) Add 0.25 *M. furfur* inoculum (adjusted to 5×10^5 cfu/ml by direct count) to each test tube of molten agar.
- 5) Vortex each tube, and pour the contents into separate petri dishes.
- 6) After the agar has solidified, invert the plates and incubate them at 30° for 5 days.
- 7) Observe the plates for visible *M. furfur* growth.

4. Determining index value

Determine the MIC index value by comparing the MIC for each anti-microbial active relative to that for ZPT, by dividing the MIC value for ZPT by the MIC value for the tested anti-microbial active. For example, if the MIC_{ZPT} value is 1.0µg/g, and the MIC_{test} value is 4.0µg/g, then the index for that test active is 1.0µg/g / 4.0µg/g, which is equal to index value of 0.25.

5

EXAMPLES

The following are non-limiting examples of the anti-dandruff and conditioning shampoo compositions of the present invention. The examples are given solely for the purpose of illustration and are not to be construed as limitations of the present invention, as many variations thereof are possible without departing from the spirit and scope of the invention, which would be recognized by one of ordinary skill in the art. In the examples, all concentrations are listed as weight percent, unless otherwise specified. As used herein, "minors" refers to those optional components such as preservatives, viscosity modifiers, pH modifiers, fragrances, foam boosters, and the like. As is apparent to one of ordinary skill in the art, the selection of these minors will vary depending on the physical and chemical characteristics of the particular ingredients selected to make the present invention as described herein.

A suitable method for preparing the anti-dandruff and conditioning shampoo compositions described in Examples I - IX (below) follows: About one-third to all of the ammonium laureth sulfate (added as 25wt% solution) is added to a jacketed mix tank and heated to about 60°C to about 80°C with slow agitation to form a surfactant solution. Cocamide MEA and fatty alcohols, (where applicable), are added to the tank and allowed to disperse. Salts (e.g. sodium chloride) and pH modifiers (e.g. citric acid, sodium citrate) are added to the tank and allowed to disperse. Ethylene glycol distearate ("EGDS") is added to the mixing vessel and allowed to melt. After the EGDS is melted and dispersed, preservative is added to the surfactant solution. The resulting mixture is cooled to about 25°C to about 40°C and collected in a finishing tank. As a result of this cooling step, the EGDS crystallizes to form a crystalline network in the product. The remainder of the ammonium laureth sulfate and other components, including the silicone and anti-dandruff agent, are added to the finishing tank with agitation to ensure a homogeneous mixture. Cationic polymer is dispersed in water as an about 0.1% to about 10% aqueous solution and then added to the final mix. Once all components have been added, additional viscosity and pH modifiers may be added, as needed, to the mixture to adjust product viscosity and pH to the extent desired.
